

# OTN Amendment to E-NNI 2.0 – RSVP-TE Signaling

**OIF-ENNI-RSVP-02.3** 

May 19, 2014

Implementation Agreement created and approved by the Optical Internetworking Forum www.oiforum.com

The OIF is an international non profit organization with over 100 member companies, including the world's leading carriers and vendors. Being an industry group uniting representatives of the data and optical worlds, OIF's purpose is to accelerate the deployment of interoperable, cost-effective and robust optical internetworks and their associated technologies. Optical internetworks are data networks composed of routers and data switches interconnected by optical networking elements.

With the goal of promoting worldwide compatibility of optical internetworking products, the OIF actively supports and extends the work of national and international standards bodies. Working relationships or formal liaisons have been established with CFP-MSA, COAST, Ethernet Alliance, Fibre Channel T11, IEEE 802.1, IEEE 802.3, IETF, InfiniBand, ITU-T SG13, ITU-T SG15, MEF, ONF, Rapid I/O, SAS T10, SFF Committee, TMF and TMOC.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

# 4 Introduction

The scope of this amendment is to define the E-NNI RSVP-TE Signaling Interface based on the E-NNI 2.0 Signaling [OIF-ENNI-RSVP-02.1], Multilayer Amendment [OIF-ENNI-ML-AM-01.0], Recovery Amendment [OIF-ENNI-REC-AM-01.0] and OTNv3 Amendment [OIF-ENNI-OTNv3-AM-01.0]. All extensions for the recovery amendment are in green colored font to help the reader identify the changes. All extensions for the multilayer amendment are in blue colored.

#### 5.1 OTNv3 Extension

The RSVP-TE signaling extensions to E-NNI 2.0 Signaling to support the OTNv3 architecture [G.709Ed4] are based on the protocol capabilities as specified in [RFC2205], [RFC3209], [RFC3471], [RFC3473], and [OTN-RSVPRFC7139].

All extensions for the OTNv3 extensions are in orange colored font to help the reader identify the changes.

The support for the earlier version of OTN [G.709Ed2] is referred to as OTNv1 in this document. The G.709 SENDER\_TSPEC/FLOWSPEC object is left unchanged and is used to establish OTNv1 connections. A new OTNv3 SENDER\_TSPEC/FLOWSPEC is introduced to support OTNv3 connections.

# 5 Terminology and Abbreviations

AMP Asynchronous Mapping Procedure

ASON Automatically Switched Optical Network (see [G.8080])

BMP Bit-synchronous Mapping Procedure

TNA Transport Network Assigned (see [G.8080])

TPN Tributary Port Number

UNI User Network Interface (see [OIF-UNI-02.0], [G.8080])
UNI-C The logical entity that performs UNI signaling on the user

<sup>&</sup>lt;sup>1</sup> The Node ID identifies a node in the transport topology graph. This definition differs from that given in the OIF UNI 2.0 specification.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

device side.

UNI-N The logical entity that performs UNI signaling on the network

device side.

VCAT Virtual Concatenation

# 6 RSVP-TE Extensions for E-NNI Signaling

The RSVP-TE extensions to support the E-NNI signaling mechanism are based on the protocol capabilities as specified in [RFC2205], [RFC2961], [RFC3209], [RFC3473], [RFC3474], [RFC3476], [RFC4328], [RFC4606] and [RFC7139]. This section provides a summary of the messages, objects, and error codes relevant to this Implementation Agreement.

## 6.1 Overview of RSVP-TE Operation

An overview of the basic RSVP-TE operation may be found in [RFC3209] and [RFC3473]. When a eNNI-U (eNNI-D) sends an RSVP message, it MUST address the message directly to its eNNI-D (eNNI-U) peer. The peer's SCN address is used for this purpose. A node (signaling protocol controller) should use IP encapsulation of RSVP messages. Furthermore, the IPv4 Router Alert option MUST NOT be set in any RSVP messages. The IPv4 header fields are shown in Table 1.

**IPv4 Header Values for E-NNI RSVP Messages** Version 4 Header Length 5 As defined in [RFC791] TOS Total Length Message length Identification As defined in [RFC791] Flags As defined in [RFC791] Fragment Offset As defined in [RFC791] TTL >= 146 Protocol Header Checksum As defined in [RFC791] Source Address eNNI-U/eNNI-D SC PC SCN IP eNNI-D/eNNI-U SC PC SCN IP **Destination Address** address

Table 1: IPv4 Header for E-NNI RSVP Messages

The format of the RSVP < Common Header > object is defined in [RFC2205], Section 3.1.1.

The flag field of the RSVP common header MUST be set to 1, to indicate support of the Bundle and Srefresh messages. As a result, an implementation MUST be able to process Bundle and Srefresh messages received from a neighbor, and MAY choose to use bundling and Srefresh when sending messages.

# 6.2 Messages and Error Codes

Table 2 provides a mapping of the abstract connection messages to specific RSVP-TE messages used to support signaling across the E-NNI interface.

**Table 2: Mapping of Abstract Messages to RSVP-TE Messages** 

Abstract Messages	RSVP-TE Messages
ConnectionSetupRequest	Path
ConnectionSetupIndication	Resv In case of error - PathErr
ConnectionSetupConfirm	ResvConf
	In case of error - PathTear
ConnectionReleaseRequest	Path or Resv (with Delete and Reflect bits (D&R bits))
	Path or Resv (with Admin and Reflect (A&R bits)) – only for compatibility with UNI/E-NNI 1.0
ConnectionReleaseIndication	PathTear or
	PathErr (w/ Path_State_Removed flag)
ConnectionQueryRequest	Implicit
ConnectionQueryIndication	Implicit
ConnectionNotification	Notify (w/ D bit set) or PathErr
ConnectionModifyRequest	Path
ConnectionModifyIndication	Resv
	In case of error - PathErr
ConnectionModifyConfirm	ResvConf
	In case of error - PathTear
Signaling Adjacency Maintenance	Hello
ConnectionActivationRequest	Path
ConnectionActivationIndication	Resv
MakePersistentRequest	Path
MakePersistentIndication	Resv

Table 3 provides information on which abstract messages are associated with each RSVP message.

**Table 3: RSVP Messages by Abstract Message** 

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

RSVP-TE Messages	Abstract Messages	
Path	ConnectionSetupRequest	
	ConnectionReleaseRequest	
	ConnectionModifyRequest	
	ConnectionActivationRequest	
	MakePersistentRequest	
Resv	ConnectionSetupIndication	
	ConnectionReleaseRequest	
	ConnectionModifyIndication	
	ConnectionActivationIndication	
	MakePersistentIndication	
PathErr	ConnectionSetupIndication	
	ConnectionReleaseIndication	
	ConnectionNotification	
	ConnectionModifyIndication	
ResvConf	ConnectionSetupConfirm	
	ConnectionModifyConfirm	
PathTear	ConnectionSetupConfirm	
	ConnectionReleaseIndication	
	ConnectionModifyConfirm	
Notify (w/ D bit set)	ConnectionNotification	
Hello	Signaling Adjacency	
	Maintenance	

Table 4 provides a mapping of the abstract error codes to specific RSVP-TE error codes and values used to support signaling across the E-NNI interface. These error codes are specified in [RFC2205], [RFC3209], and [RFC4974].

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

Table 4: Mapping of Abstract Error Codes to RSVP-TE Error Codes and Values

Abstract Errors	RSVP-TE Error Codes/Error Values
Calling Party Busy	ERROR_SPEC 24/5
Called Party Busy	ERROR_SPEC 24/103
Unauthorized sender (policy error)	ERROR_SPEC 2/100
Unauthorized receiver (policy error)	ERROR_SPEC 2/101
Invalid / unknown connection ID	ERROR_SPEC 24/102
Invalid / unknown call ID	ERROR_SPEC 24/105
Invalid SNP	ERROR_SPEC 24/6 or 24/11 or 24/12 or
	24/14
Unavailable SNP	ERROR_SPEC 24/6 or 24/11 or 24/12 or
	24/14
Invalid SNPP	ERROR_SPEC 24/104
Unavailable SNPP	ERROR_SPEC 24/104
Unavailable directionality	ERROR_SPEC 24/6 or 24/11
Invalid SPC SNP	ERROR_SPEC 24/106
Invalid route	ERROR_SPEC 24/1, 24/2, 24/3, or 24/7
Invalid recovery	ERROR_SPEC 24/15 or 24/100
Unavailable recovery	ERROR_SPEC 24/15 or 24/100
Unavailable service level	ERROR_SPEC 24/101 or 2/{any}
Service-affecting defect	ERROR_SPEC 24/5, 24/9, 24/100, 24/101
	or 24/103
Non-service-affecting defect	General protocol error: general RSVP-TE
	error codes/values

# 6.2.1 Hello Message (Msg Type = 20 [RFC3209])

This message is specified in [RFC3209].

The Hello message is used to establish a signaling adjacency and for communications failure detection. It has the following format:

```
<Hello message> ::= <Common Header>
<HELLO>
<RESTART_CAP>
```

Hello messages are retransmitted periodically to an adjacent E-NNI signaling peer. The retransmission interval SHALL be administratively configurable. The default value is 5 seconds.

# 6.2.2 Path Message (Msg Type = 1 [RFC2205])

This message is specified in [RFC2205], with further extensions made by [RFC2961], [RFC3209], and [RFC3473].

E-NNI OTNv3 Amendment - RSVP-TE Signaling

**Note:** The GENERALIZED\_UNI object is always present because it will either be provided by a UNI client initiating, adding, or deleting, a connection, or it will be provided by the ingress domain when initiating an SPC or hybrid connection to carry the source and destination TNAs, as well as other optional GENERALIZED\_UNI sub-objects. This does not imply that intermediate NNI nodes should be able to process the GENERALIZED\_UNI object, only that they are able to forward it between the source and destination of the connection. The format of the < Generalized UNI > and <sender descriptor> objects are described in [OIF-UNI-02.0-R2-RSVP], Section 9.1.3 "Path Message".

E-NNI OTNv3 Amendment – RSVP-TE Signaling

A Path message establishing a unidirectional connection over an NNI interface does not include an UPSTREAM LABEL object.

# 6.2.3 Resv Message (Msg Type = 2 [RFC2205])

This message is specified in [RFC2205], with further extensions made by [RFC2961], [RFC3209], and [RFC3473]. The Resv message is used for connection creation and call/connection modification. The RESV\_CONFIRM object may be included in the Resv message to request a ResvConf message to confirm the connection setup. Once the RESV\_CONFIRM object has been included in the Resv message, it would normally be included in full refreshes of the Resv without generating additional ResvConf messages in response. A subsequent trigger change in the Resv message MAY result in a new ResvConf response. To force a new ResvConf message, the RESV\_CONFIRM object SHOULD be removed from the Resv message and then inserted into a subsequent Resv message so that the change acts as a trigger for a new ResvConf.

The format of the E-NNI Resv message is as shown below:

E-NNI OTNv3 Amendment – RSVP-TE Signaling

```
[ <POLICY_DATA> ... ]
   [<RESV_CONFIRM>]
   [<OIF_RESV_VENDOR_PRIVATE_EXTENSION_TYPE_1>]

   <RECOVERY> | <RECOVERY_LIST> <RECOVERY>
```

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

#### <RECOVERY> ::= <PROTECTION>

#### 6.2.4 ResvConf Message (Msg Type = 7 [RFC2205])

This message is specified in [RFC2205], with further extensions made by [RFC2961], [RFC3209], and [RFC3473]. Note that the Call Name (CALL\_ID) is not included in the ResvConf message, in accordance with [RFC3474]. As a result, the attributes are not aligned with the abstract Connection Setup Confirm message. It is still possible to correlate the ResvConf message with the proper Resv state based on the SESSION and flow descriptor.

The ResvConf message is originated at the source UNI-C to acknowledge the receipt of a trigger<sup>2</sup> Resv message that includes a RESV\_CONFIRM Object. ResvConf messages are sent from the source UNI-C to the corresponding UNI-N, and from the destination UNI-N to the destination UNI-C. While the E-NNI processes ResvConf on a hop by hop basis, the message scope is endto-end, and the network MUST relay the ResvConf message from source UNI-N to destination UNI-N.

The format of the ResvConf message is shown below:

```
<ResvConf message> ::= <Common Header>
   [ [ <MESSAGE_ID_ACK> | <MESSAGE_ID_NACK> ] ... ]
   <MESSAGE_ID>
   <SESSION> <ERROR SPEC>
   <RESV CONFIRM>
   <STYLE>
   <FLOW SPEC > | <FILTER SPEC>
```

#### 6.2.5 PathTear Message (Msg Type = 5 [RFC2205])

This message is specified in [RFC2205], with further extensions made by [RFC2961], [RFC3209], and [RFC3473].

```
<PathTear Message> ::= <Common Header>
   [ [ <MESSAGE_ID_ACK> | <MESSAGE_ID_NACK> ] ... ]
   <MESSAGE ID>
   <SESSION>
     <CALL_ID>
     <RSVP_HOP>
   <sender descriptor>
                      /* (see Section 6.2.2) */
```

<sup>&</sup>lt;sup>2</sup> A trigger Resv message is a message that modifies the reservation state. Examples include the original Resv message sent during connection establishment in response to the first Path message and the Resv message that includes a change in the FILTER SPEC object sent during connection modification.

## 6.2.6 PathErr Message (Msg Type = 3 [RFC2205])

This message is specified in [RFC2205], with further extensions made by [RFC2961], [RFC3209], and [RFC3473]. The PathErr message is used to report errors and for connection deletion.

The format of the E-NNI PathErr message is as follows:

```
<PathErr message> ::= <Common Header>
  [ [ <MESSAGE_ID_ACK> | <MESSAGE_ID_NACK> ] ... ]
  <MESSAGE_ID>
  <SESSION>
  <CALL_ID>
  <ERROR_SPEC>
  [ <ACCEPTABLE_LABEL_SET> ]
  [ <POLICY_DATA> ... ]
  <sender descriptor> /* see Section 6.2.2*/
```

# 6.2.7 Notify Message (Msg Type = 21 [RFC3473])

The Notify message is used to support intermediate node initiated deletion, and the ADMIN\_STATUS object is mandatory. This message is specified by [RFC3473].

www.oiforum.com

\_

<sup>&</sup>lt;sup>3</sup>In E-NNI Signaling 2.0, the ADMIN\_STATUS is mandatory in the Notify message. This is because the Notify message is used in E-NNI Signaling 2.0 to support intermediate node initiated deletion.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

<FF flow descriptor> | <SE flow descriptor> /\* 1 or more flow descriptor \*/

Note that the downstream notify session adds the ADMIN\_STATUS object as per [RFC4974]. It enables the following situations to be handled:

- a) a UNI/ENNI 1.0 node allows sending network deletion both upstream and downstream. If there was a UNI/ENNI 1.0 node upstream of an ENNI 2.0 interface, the ENNI 2.0 interface may receive a downstream network deletion request from the UNI/ENI 1.0 node.
- b) a network I-NNI domain may initiate a downstream graceful deletion.

Note that the IETF model allows a NOTIFY Message to be sent to any recipient. The E-NNI 2.0 IA uses the NOTIFY Message only to perform Graceful Deletions for intermediate nodes, so the NOTIFY Message can only be directed to nodes with an upstream or downstream signaling adjacency with this node. The NOTIFY message has end-to-end significance, though it is processed on a hop by hop basis, and MUST be forwarded to continue the intermediate deletion message flow.

## 6.2.8 Srefresh Message

This message is specified by [RFC2961].

# 6.2.9 Ack Message

This message is specified by [RFC2961].

#### 6.3 Attributes

Table 5 provides a mapping of the abstract attributes to specific RSVP-TE objects used to support signaling across the E-NNI interface.

Table 5: Mapping of Abstract Attributes to RSVP-TE Objects

Abstract Attributes	RSVP-TE Objects
Source TNA name	GENERALIZED_UNI/Source_TNA
Destination TNA name	GENERALIZED_UNI/Destination_TNA
DEST SNP ID	GENERALIZED_UNI/SPC_LABEL
Initiating NCC PC ID	SENDER_TEMPLATE
Terminating NCC PC ID	SESSION
Connection name	SESSION + SENDER_TEMPLATE
Call name	CALL_ID
SNP ID	SENDER_TSPEC, RSVP_HOP, LABEL, GENERALIZED_UNI/EGRESS_LABEL
SNPP ID	RSVP_HOP <sup>4</sup> , LABEL_SET

<sup>&</sup>lt;sup>4</sup> The "IPv4 Next/Previous Hop Address" field of the RSVP\_HOP object is not part of the SNPP ID as it is a control address.

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

Abstract Attributes	RSVP-TE Objects	
	OIF_INV_MUX_IF_ID	
Directionality	Implied by UPSTREAM_LABEL	
Explicit route	EXPLICIT_ROUTE, RECORD_ROUTE, OIF_VENDOR_PRIVATE_ERO, OIF_VENDOR_PRIVATE_RRO

Multilayer Signaling Based Discovery	OIF_LSP_TUNNEL_INTERFACE_ID	
	OIF_RECOVERY_STACK	
	ENNI Recovery sub-object: ASSOCIATION	
Recovery	ENNI Recovery sub-object: PROTECTION	
	ENNI Recovery sub-object: PRIMARY_PATH_ROUTE	

Table 6 provides a summary of the various objects used to support E-NNI signaling, along with codepoints assigned to the objects that are relevant to support the applications across the E-NNI interface. Note that this table only specifies the codepoints that are relevant to the OIF E-NNI specification and does not list all available codepoints (e.g., SENDER\_TEMPLATE only lists C-type 7). Also, unless otherwise specified in this section, formats of these objects are as defined in the associated reference.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

Table 6: Summary of RSVP-TE E-NNI Objects

RSVP-TE Object	Class-Num/ C-type[/ Type/ [Sub-type]]	Reference

	OIF_INV_MUX_TSPEC (2/1)	Refer to section 6.3.11.3 for OIF_RECOVERY_STACK
	OIF_INV_MUX_FLOWSPEC (3/1)	on_ngeo (Bri_siner
	OIF_RECOVERY_STACK (4/1)	
OIF_VENDOR_PRIVATE_	252/1	Refer to [OIF-RSVP-Ext]
EXTENSION_TYPE_3	OIF_LSP_TUNNEL_INTERFA CE_ID (2/1)	and section 6.3.12
	OIF_VENDOR_PRIVATE_ER O (3/1)	
	OIF_VENDOR_PRIVATE_RR O (4/1)	
	OIF_ML_ADAPTATION (5/1)	

Note 1: The absence of this object is equivalent to receiving an object containing values all set to zero (0).

Note 2: {text} where text is a comment.

Note 3: <...> indicates the different C-types or sub-types defined for the particular object.

Note 4: The port identifier contained in the SPC\_LABEL sub-object is the logical port identifier assigned at the destination UNI-N; the port identifier contained in the EGRESS\_LABEL sub-object is a logical port identifier assigned at the destination UNI-C.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

Note 5: The format of LABEL is dependent on the signal types defined by LABEL\_REQUEST object.

Note 6: A LABEL\_SET object contains a list of "sub-channels" whose type is inferred from the label type field. Each of the sub-channels represents a label (wavelength, fiber, timeslot, etc.). A given LABEL\_SET object MUST include a single label type. The interpretation of the label depends on the type of the link over which the label is to be used, so each sub-channel does NOT need its own header within the LABEL\_SET object.

Note 7: MESSAGE\_ID\_NACK is a sub-type of MESSAGE\_ID\_ACK.

Note 8: RSVP\_HOP Types 4 and 5 SHOULD NOT be generated but MUST be supported if received for E-NNI 1.0 backward compatibility.

Note 9: Both "fixed filter" and "shared explicit" styles are used.

Note 10: The value MUST be coordinated with Srefresh intervals to ensure proper refresh of the state information.

# 6.3.1 ERROR\_SPEC

The IPv4 IF\_ID\_ERROR\_SPEC (class = 6, C-Type = 3) is defined in [RFC3473]. The IPv4 IF\_ID\_ERROR\_SPEC MUST be supported. In E-NNI signaling, the error node address MUST be set to the SC PC ID of E-NNI (Identifier of eNNI-U or eNNI-D) that reported the error.

During graceful deletion, the path\_State\_Removed flag SHOULD be set, and Error Code 0 (confirmation) and Error Value 0 SHOULD be used.

When the Error Code is non-zero, the IPv4 IF\_ID\_ERROR\_SPEC SHOULD contain an IPv4 (Type 1) or an IPv4 IF\_INDEX (Type 3) sub-object, as defined in [RFC3471]. The content of the IPv4 sub-object or IF\_INDEX sub-object is significant for routing, and the identifiers used are those advertised by E-NNI 2.0 Routing and signaled in the ERO. The IF\_INDEX sub-object corresponds to a hop in the ERO. In addition to either a Type 1 or Type 3 sub-object, further objects may be included using definitions in [RFC4920].

The Type 1 object reports a whole transport node failure, and the IPv4 Address is the Node ID of the failed node. The Type 3 sub-object also carries an interface ID, specifying a link failure at that transport node.

The format of the [RFC3473] IF\_ID ERROR\_SPEC, Type 1 sub-object is depicted below:

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

```

The format of the [RFC3473] IF\_ID ERROR\_SPEC, Type 3 sub-object is depicted below:

For failure notification during Recovery two additional sub-objects may be used: REPORTING\_OSPF\_AREA and LINK\_EXCLUSIONS (see section 6.7.4).

The format of the [RFC4920] REPORTING\_OSPF\_AREA, Type 22 sub-object is depicted below:

Note that this sub-object is used to carry a recovery domain identifier (i.e. a Routing Area identifier), not an OSPF area ID.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

The format of the [RFC4920] LINK\_EXCLUSIONS, Type 27 sub-object is depicted below:

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
```

Link Identifiers is a sequence of type 3 TLVs as defined above.

## 6.3.2 EXPLICIT\_ROUTE

The Explicit Route Object Class is 20 and C\_Type 1. The EXPLICIT\_ROUTE object has the following format [RFC3209]:

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2
```

The sub-objects in the ERO MUST be used to select transport links that the connection will travel through. The sub-objects of Type 3 (Label) defined in [RFC3473] and Type 4 (Unnumbered interface ID) defined in [RFC3477] MUST be supported in the E-NNI. As mentioned in [OIF-ENNI2.0-SIG] Section 7.1, Table 1, E-NNI 2.0 maps the ASON SNPP ID definition into the tuple <RA ID, NodeID, IfIndex>. Note that the abstract RA ID is implied by NodeId, and does not appear explicitly in any signaling object. As a consequence, the ERO HOP Types 1, 2, and 32 are not required and not supported.

0	1	2	3		
0 1 2 3 4 5 6 7 8	9 0 1 2 3 4 5 6 7	8 9 0 1 2 3 4	5 6 7 8 9 0 1		
+-+-+-+-+-+-		+-+-+-+-+-	+-+-+-+-+-+		
L  Type	Length	Reserved (MUS	T be zero)		
+-					
Router ID					
+-					
	Interface ID (	32 bits)			
+-+-+-+-+-+-+-+-		+-+-+-+-+-+-	+-+-+-+-+-+-+		

In the Type 4 (Unnumbered interface ID) sub-object, depicted above, the L bit SHALL NOT be set in any of the ERO sub-objects.

The Router ID MUST be set to "Node" ID and is a transport plane name. The Interface ID is the identifier assigned to the "link" by the transport "node". It could indicate a single link or bundled link.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

Both node ID and Interface ID refer to the upstream node. This choice simplifies processing of the ERO by providing a single encoding optimized for the most common situation of the processing node being at the ingress end of a link.

An example showing the specification of Explicit Route Objects in Path messages is shown in Figure 1.

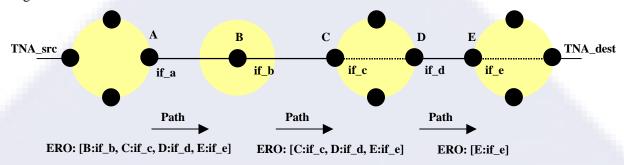

Figure 1: Example ERO Specification

#### Inverse Multiplexing and Transitional Link support

Figure 2 shows an example ERO specification for transitional links and inverse multiplexing. Server-layer EROs are nested in the client layer ERO. For this purpose, a new Sub-Type is defined for OIF Vendor Private EXPLICIT\_ROUTE [OIF-RSVP-Ext] sub-object. For inverse multiplexing, the ERO for each member is encoded in an OIF Vendor Private EXPLICIT\_ROUTE sub-object with a new sub-type. When a client layer makes an interlayer call setup request into a server layer, it removes the nested ERO from the client layer signaling and passes it as a parameter to the interlayer call setup request. For example, at node 2, the Nested\_ERO\_1 is removed from the Client layer ERO and passed to node 3 in the interlayer call setup request. A server layer that receives a nested ERO that consists of a list of INV\_MUX\_EROs will parse the list and use one ERO per connection it establishes. For example, at node 5, the Nested\_ERO\_2 is parsed and two INV\_MUX\_EROs are extracted. Each ERO is used to establish a connection.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

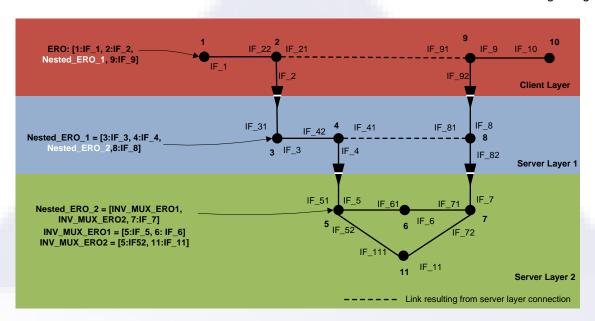

Figure 2: Inverse Multiplexing and Nesting ERO Representations

Nested and inverse multiplexing ERO sub-objects follow [OIF-RSVP-Ext] format for OIF Vendor Private EXPLICIT\_ROUTE sub-objects, introducing a new sub-type as described below that contains a pointer to an OIF\_VENDOR\_PRIVATE\_ERO sub-object in the OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE 3 object. The OIF\_VENDOR\_PRIVATE\_ERO\_ID is an identifier that is unique in the scope of the PATH message in which it is sent and it identifies an OIF\_VENDOR\_PRIVATE\_ERO sub-object. The OIF\_VENDOR\_PRIVATE\_ERO sub-object is described in Section 6.3.12.2.

# Support for ODU multiplexing hierarchy

Each level of the ODU multiplexing hierarchy is treated as a separate layer. The OIF Vendor Private EXPLICIT\_ROUTE object is used to encode multiple levels of the ODU multiplexing hierarchy similar to the use of this object for multiplexing signaling.

Figure 3 shows an example of three levels of ODU multiplexing. In this example, an ODU0 client is being routed from node 1 to node 6. At node 2, the ODU0 is multiplexed into an ODU1 connection. At node 3, the ODU1 is multiplexed into an ODU2 connection. The ODU2 connection is transported through node 4 to node 5 where the ODU2 and ODU1 layers are terminated, and the ODU0 is demultiplexed to send to node 6.

Within the ERO for the ODU0 there is a Type 124 OIF Vendor Private ERO object with an OIF\_VENDOR\_PRIVATE\_ERO\_ID that points to the ODU1\_NESTED\_ERO. The ODU1\_NESTED\_ERO is carried in the OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_3

E-NNI OTNv3 Amendment - RSVP-TE Signaling

object and provides the ERO for the ODU1 server layer. Likewise, within the ODU1 ERO is another Type 124 OIF Vendor Private ERO object with an OIF\_VENDOR\_PRIVATE\_ERO\_ID that refers to the ODU2 NESTED ERO that represents the ODU2 server layer.

Note that the ODU multiplexing hierarchy is represented as adaptations conveyed using the OTNv3 SCSI in routing. As such, there is not an explicit transitional link representing the transition between layers.

Signaling for the ODU0 layer begins at node 1. At node 2, the ODU1\_NESTED\_ERO is extracted and used for signaling the ODU1 connection. At node 3, the ODU2\_NESTED\_ERO is extracted and used for signaling the ODU2 connection. The signaling session for the ODU2 connection will create the IF\_31-IF53 link in the ODU1 layer. Similarly, the ODU1 signaling will create the IF\_21-IF\_51 link in the ODU0 client layer.

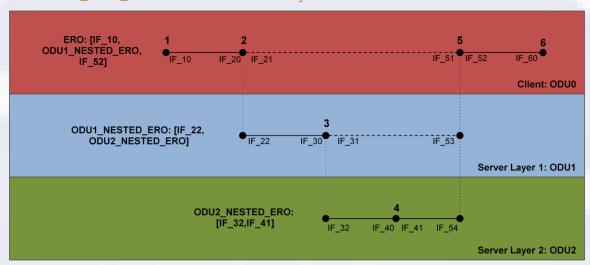

Figure 3: ERO for Multiple ODU layers

## 6.3.3 Record Route Object

The RECORD\_ROUTE object is defined in [RFC3209]. The object contains a series of variable-length data items called sub-objects. Two of the sub-objects defined by the IETF for the RRO object MAY be used in E-NNI 2.0 signaling (Table 7).

Sub-object	Туре	Contents		
Label	0x03	Use is as defined in [RFC3209] and extended in [RFC3473].		
Unnumbered IPv4	0x04	Use is as defined in [RFC 3477].		
		NodeID is used for RouterID.		

**Table 7: RRO Sub-objects** 

All other RRO sub-objects MUST NOT be used in E-NNI 2.0 signaling.

The RRO object syntax is designed such that, with minor changes, the whole object can be used as input to the EXPLICIT\_ROUTE object. Consequently, the RRO objects MAY identify a link

E-NNI OTNv3 Amendment – RSVP-TE Signaling

by specifying only the *upstream* link end, only the *downstream* link end, or by specifying *both* link ends.

#### Inverse Multiplexing and Transitional Link support

RRO specification for transitional links and inverse multiplexing is aligned with the ERO specification. Server layer RROs are nested in the client layer RRO. When a server layer returns an interlayer call setup indication to a client layer, it includes an RRO gathered by the server layer signaling, provided an RRO was requested by the client layer. For example, at node 3, an RRO containing similar information as contained in Nested\_ERO\_1 is returned to node 2 in the interlayer call setup indication. An inverse multiplexing server layer combines the INV\_MUX\_RROs for all of its connections into a single RRO that is returned to the client layer in the interlayer call setup indication. For example, at node 5, a nested RRO that contains a list of INV\_MUX\_RROs is returned to node 4 in the interlayer call setup indication.

Nested and inverse multiplexing RRO sub-objects follow [OIF-RSVP-Ext] format for OIF Vendor Private RECORD\_ROUTE sub-objects, introducing a new sub-type as described below that contains a pointer to an OIF\_VENDOR\_PRIVATE\_RRO sub-object in the OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE 3 object. The OIF\_VENDOR\_PRIVATE\_RRO\_ID is an identifier that is unique in the scope of the PATH or RESV message in which it is sent. The OIF\_VENDOR\_PRIVATE\_RRO sub-object is described in Section 6.3.12.3.

0	1	2	3
0 1 2 3 4 5 6	7 8 9 0 1 2 3	4 5 6 7 8 9 0 1 2 3	4 5 6 7 8 9 0 1

2 ± ±		-+-+-+-+-+-+-+	
SMI Enterpr.	Code (continue	ed)   OIF VENDOR PRIV	ATE RRO ID
<del>-</del>		-+-+-+-+-+-+-+	

## Support for ODU multiplexing hierarchy

The RRO for recording the route of multiple ODU hierarchy levels follows a similar encoding as the ERO. For each ODU server layer, a Type 252 OIF Vendor Private RECORD\_ROUTE sub-object (see above) is inserted into the immediately adjacent ODU client layer. The OIF\_VENDOR\_PRIVATE\_RRO\_ID within this RRO subobject points to an OIF\_VENDOR\_PRIVATE\_RRO object carried in the OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_3 object. The OIF\_VENDOR\_PRIVATE RRO records the detailed route information for the ODU server layer. This process recurses until the top-most level of the ODU hierarchy is reached.

## 6.3.4 Generalized UNI Object

This object is used to specify the calling and called party identifiers and other call attributes. They are requested by the user through the control plane (UNI signaling) or by the management plane (configured at the network side). The attributes are used by the called party call controller and may be used by the destination network call controller for call validation. While the majority of

E-NNI OTNv3 Amendment - RSVP-TE Signaling

sub-objects must be transmitted by E-NNI signaling without any alteration, some sub-objects may be translated when the E-NNI is used between carriers. As an example, the Service Level value may be translated when going from one domain to another.

The contents of a GENERALIZED\_UNI object are a series of variable-length data items. For future compatibility, the Type and Sub-Type values are assigned according to the rules pertaining to RSVP objects ([RFC2205], Section 3.10), but from their own number space. The treatment of future Type and Sub-Type values is the same as specified for RSVP Class-Num and C-Type, respectively. If an error message is to be sent due to an unrecognized Type or SubType value, a node SHOULD use the error code "unknown Class-Number" or "unknown C-Type with known Class-Number" and the error value set to the Class-Number and C-Type of the GENERALIZED\_UNI object.

Note that in E-NNI 2.0, the EGRESS\_LABEL (Type 4 sub-object) or SPC\_LABEL value is set to zero when a label value is not required. The particular egress label type provided does not specify whether signaling is active on the egress interface or not. For multilayer endpoints, the SPC\_LABEL MUST be used when an egress logical port identifier is required.

The GENERALIZED\_UNI object is carried in the Path message of a recovery connection. The source and destination TNAs (and the service level, etc.) are the end-to-end ones. They generally do not identify the recovery connection endpoints in its recovery domain. See section 6.7.2 for more details about the identification of the recovery connection endpoints.

# 6.3.5 RESV\_CONFIRM

The IPv4 RESV\_CONFIRM (class = 15, C-Type =1) object is defined in [RFC2205]. IPv4 RESV\_CONFIRM MUST be supported.

In E-NNI signaling, the receiver address MUST be set to the SC PC ID of the downstream E-NNI (Identifier of eNNI-D).

#### 6.3.6 RSVP HOP

There are two types of RSVP\_HOPs supported at the E-NNI: IF\_ID RSVP\_HOP (C-Type 3) and IPv4 RSVP\_HOP (C-Type 2) The IPv4 RSVP\_HOP MUST be used at the VCAT layer. IF\_ID RSVP\_HOP MUST be used for all other layers. Use of the Type 2 TLV in transport networks is not supported and is for further study.

#### 6.3.6.1 IF ID RSVP HOP

The format of this object is provided in [RFC3473]:

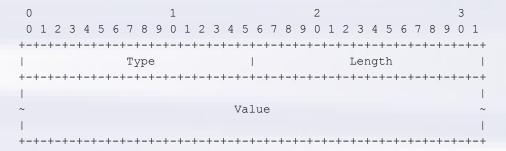

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

0	1	2		3
0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5	6 7 8 9 0 1 2 3	3 4 5 6 7 8 9	0 1
+-+-+-+-+-+-+-+-+-	+-+-+-+-+	-+-+-+-+-+-+	-+-+-+-+-	+-+-+
Length	1	Class-Num (3)	C-Type (3)	
+-+-+-+-+-+-+-+-	+-+-+-+-+	-+-+-+-+-+-	-+-+-+-+-	+-+-+
I P	v4 Next/Previ	ous Hop Address	3	
+-+-+-+-+-+-+-+-	+-+-+-+-+-+	-+-+-+-+-+-	-+-+-+-+-+-	+-+-+
	Logical Int	erface Handle		
+-+-+-+-	+-+-+-+-+	-+-+-+-+-+-	-+-+-+-	+-+-+
I				
~	$\operatorname{TL}$	Vs		~
1				
, +-+-+-+-+-	+-+-+-+-+	-+-+-+-+-+-+-	-+-+-+-+-	+-+-+

The IPv4 Next/Previous Hop Address field SHOULD be set to the SC PC ID (Identifier of the eNNI-U or eNNI-D) corresponding to this link. In Path messages, it contains the corresponding SC PC ID of the upstream domain and in Resv messages the corresponding SC PC ID of the downstream domain.

As described in [RFC2205], a node receiving an LIH (Logical Interface Handle) in a Path message saves its value and returns it in the HOP objects of subsequent Resv messages sent to the node that originated the LIH. Other than satisfying this requirement, *a node receiving an LIH should not expect to receive any specific value in the LIH*. Nodes MAY include a value equal to that of the interface ID (see below) or 0.

The format of TLVs is defined in [RFC3471]:

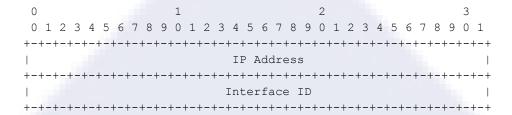

The Type 3 MUST be supported:

Type	Length	Format	Description		
3	12	See below	IF_INDEX	(Interface Inde	x)

For Type 3 the Value field has the format:

E-NNI OTNv3 Amendment - RSVP-TE Signaling

The IF\_ID\_RSVP\_HOP object MUST be used to select the transport link where a connection's resources should be allocated. The IP Address field should be set to the node ID corresponding to this link.

- For a unidirectional LSP, a downstream data link MUST be indicated.
- For bidirectional LSPs, a common downstream and upstream data link is normally indicated. In the special case where a bidirectional LSP traverses a bundled link, it is possible to specify a downstream data link that differs from the upstream data link. When two RSVP\_HOP sub-objects are required, the Type 3 sub-object MUST be used as follows:
- The first sub-object MUST represent the downstream data link
- The second sub-object MUST represent the upstream data link

The interface ID carries the interface identifier for a single link or a bundled component link. The mapping of Interface IDs should be maintained at both the eNNI-U and eNNI-D i.e., the local and remote interface ID might not be identical.

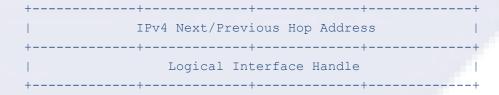

Note: Use of node identifiers beyond IP addresses may be desirable (for example specifying nodes by a name). Support for this capability is for further study.

#### 6.3.6.2 IPv4 RSVP HOP

For the inverse multiplexing case, the IPv4 RSVP\_HOP is used and an OIF vendor private extension carries the multiple interface ids as described in section 6.3.11.1.

The regular IPv4 RSVP\_HOP [RFC2205] is used as follows:

```
IPv4 RSVP_HOP object: Class = 3, C-Type = 1
```

The IPv4 Next/Previous Hop Address field SHOULD be set to the SC PC ID (Identifier of the eNNI-U or eNNI-D) corresponding to interface ids that are inverse multiplexed. The LIH should be treated as for IF\_ID\_RSVP\_HOP described above.

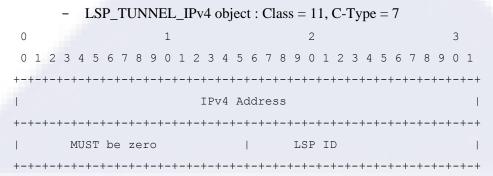

E-NNI OTNv3 Amendment - RSVP-TE Signaling

## 6.3.7 SENDER TEMPLATE

The LSP\_TUNNEL\_IPv4 object (C-Type = 7) is defined in [RFC3209]. The LSP\_TUNNEL\_IPv4 MUST be supported, and MUST be used in SENDER\_TEMPLATE and FILTER\_SPEC across E-NNI interfaces. The LSP\_TUNNEL\_IPv4 object has the following format [RFC3209]:

IPv4 Address: This MUST be set to the SC PC ID of the upstream E-NNI (Identifier of eNNI-U).

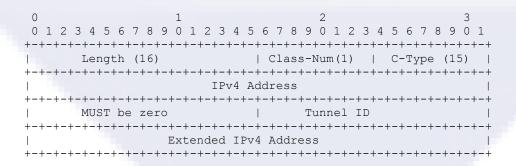

LSP ID: A 16-bit identifier used in the SENDER TEMPLATE and the FILTER SPEC.

The combination of the LSP\_TUNNEL\_IPv4\_SENDER\_TEMPLATE object and E-NNI\_IPv4\_SESSION object MUST uniquely identify a connection at a local E-NNI. In the case of connection bandwidth modification using the make-before-break procedure, the LSP\_TUNNEL\_IPv4\_SENDER\_TEMPLATE LSPID will change during the duration of the connection; all other parameters specified by these two objects remain unmodified. Otherwise, these two objects remain unmodified for the duration of the connection. An unrecognized connection ID SHOULD result in an error message with error code "Routing Problem: Invalid/Unknown Connection ID".

#### 6.3.8 SESSION

The E-NNI\_IPv4 SESSION object (C-Type = 15) is defined in [RFC 3474]. The E-NNI\_IPv4 SESSION MUST be supported across E-NNI interfaces. The SESSION object with C-Type = 15 has the following format:

- E-NNI\_ IPv4\_SESSION object: Class = 1, C-Type = 15

IPv4 Address: This MUST be set to the SC PC ID of the downstream E-NNI (eNNI-D).

E-NNI OTNv3 Amendment - RSVP-TE Signaling

Tunnel ID: A 16-bit identifier, assigned by the sender of the Path message. This ID remains constant during the life of a connection.

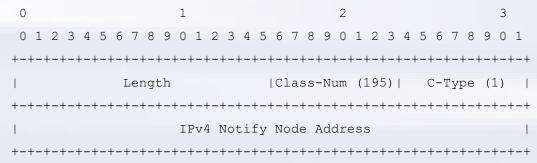

Extended IPv4 address: This MUST be set to the SC PC ID of the upstream E-NNI (Identifier of eNNI-U).

The combination of the LSP\_TUNNEL\_IPv4\_SENDER\_TEMPLATE object and E-NNI\_IPv4\_SESSION object MUST uniquely identify a connection at a local E-NNI. In the case of connection bandwidth modification using the make-before-break procedure, the LSP\_TUNNEL\_IPv4\_SENDER\_TEMPLATE LSPID will change during the duration of the connection; all other parameters specified by these two objects remain unmodified. Otherwise, these two objects remain unmodified for the duration of the connection.

An unrecognized connection ID SHOULD result in an error message with error code "Routing Problem: Invalid/Unknown Connection ID".

## 6.3.9 NOTIFY REQUEST

The Notify Node Address field contains the SC PC ID of the E-NNI node that generates the object:

## 6.3.10 INTSERV\_TSPEC and FLOWSPEC

For SONET/SDH VCAT layer signaling, the PATH message MUST include the INTSERV\_TSPEC [RFC2210] and the RESV message MUST include the INTSERV\_FLOWSPEC. The requested VCAT data rate MUST be used to fill the Peak Data Rate for the TSPEC and FLOWSPEC objects. All other fields of the INTERV\_TSPEC and INTSERV FLOWSPEC MUST be filled as follows:

0 1		2	3
0 1 2 3 4 5 6 7 8 9 0 1 2	2 3 4 5 6 7 8 9	0 1 2 3 4 5 6 7	7 8 9 0 1

## 6.3.11 OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1

OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1 [OIF-RSVP-Ext] carries the OIF INV MUX IF ID, OIF INV MUX TSPEC and OIF INV MUX FLOWSPEC.

## 6.3.11.1 OIF INV MUX IF ID

The OIF\_INV\_MUX\_IF\_ID is the first level sub-object used to carry the list of interface identifiers that represent the components that carry the inverse multiplexed traffic. The first level sub-object includes a list of second level sub-objects defined below.

0	1	2	3
0 1 2 3 4	1 5 6 7 8 9 0 1 2 3 4	5 6 7 8 9 0 1 2 3 4	5 6 7 8 9 0 1

~	Second Level	l Sub-objects	~
+-+-+-+-	-+-+-+-+-+-+-+-+-	+-+-+-+-+-+-+-+	-+-+-+-+-+

## Inverse Multiplexing Interface Identifier List (INV\_MUX\_IF\_ID\_LIST) second level sub-object

Each sub-object includes a list of interface identifiers for the specified signal type. If all member constituents are of the same signal type, a single second level sub-object is present. For example, a VC-4-7v would have a single INV\_MUX\_IF\_ID\_LIST second level sub-object with a Signal Type of VC-4 and 7 interface identifiers.

0	1	2	3
0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5	6 7 8 9 0 1 2 3 4 5	5 6 7 8 9 0 1

+-+-+-+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+-+-+-+-+-+-	-+-+-+-+-+
I	nterface ID		
+-+-+-+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+-+-	-+-+-+-+-+-+

# Signal Type:

For SONET/SDH VCAT (as indicated by an Encoding Type set to SONET/SDH in the Generalized Label Request), the Signal Type represents the constituent signal type as defined in [RFC4606].

E-NNI OTNv3 Amendment – RSVP-TE Signaling

#### Reserved:

The bits SHOULD be set to 0 when sending, ignored upon receipt.

#### Interface ID:

The nth sub-object MUST represent the nth member data link added to the inverse multiplexing group. Each sub-object's interface id corresponds to a TCP returned by the server layer corresponding to a member connection.

The mapping of interface IDs should be maintained at both the eNNI-U and eNNI-D i.e., the local and remote interface ID might not be identical. Interface identifiers are specified from the viewpoint of the sender of the Path message. The same identifiers are specified in the Resv message.

In order to allow VCAT group size changes, the object is allowed to be modified using non-disruptive connection modification signaling procedures described in section 6.4.2.4.

The number of Interface IDs MUST correspond to the number of member field of OIF INV MUX TSPEC/FLOWSPEC.

## 6.3.11.2 OIF\_INV\_MUX\_TSPEC/FLOWSPEC

The OIF\_INV\_MUX\_TSPEC (Class-Number 2) is the first level sub-object used to carry the inverse multiplexing traffic parameters in the PATH message. The OIF\_INV\_MUX\_FLOWSPEC (Class-Number 3) is the first level sub-object used to carry the inverse multiplexing traffic parameters in the RESV message.

0	1	2	3					
0 1 2 3 4 5	6 7 8 9 0 1 2 3 4	5 6 7 8 9 0 1 2 3 4 5 6 7	8 9 0 1					
+-+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-+-+-+-+-+-+-+-	+-+-+-+					
Length   Class-Num (2/3)   C-Type (1)								
+-+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-+-+-+-+-+-+-+-	+-+-+-+					
Signal Type   # Members   Flags								
+-								

The Signal type takes one of the following values:

Value Signal Type (Inverse Multiplexing Type)

The Number of members represents the number of constituents that are inversely multiplexed and included in the INV\_MUX\_IF\_ID\_LIST.

For a signal type of VCAT (1), the following flags are defined:

Flags:

E-NNI OTNv3 Amendment - RSVP-TE Signaling

L: LCAS is required. If LCAS is not available, the request MUST be rejected.

## 6.3.11.3 OIF\_RECOVERY\_STACK object

[OIF-ENNI-REC-AM-01.0] identified the need to carry per recovery domain recovery information as summarized below:

- At an E-NNI interface within a recovery domain, the PROTECTION and ASSOCIATION objects used for signaling of the recovery mechanism chosen in that recovery domain are encapsulated into an E-NNI Recovery sub-object. This applies both to the signaling of the working and the recovery connections.
- For shared-mesh restoration, a PRIMARY\_PATH\_ROUTE object may be included during the signaling of a recovery connection: it is also encapsulated into an E-NNI Recovery sub-object. If intermediate nodes have to make a decision about resource sharing between recovery connections, then this parameter MUST be provided. If the recovery connection Explicit Route specifies all resources down to the labels (it may have been computed by a PCE for instance), the Explicit Route itself implies whether resources are shared or not with other recovery connections, and the PRIMARY\_PATH\_ROUTE object is therefore not needed.

Such recovery information is carried in a first-level sub-object of the OIF OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1 vendor private object, as defined in [RSVP-PVT-EXT-01.0]. This first-level sub-object is called OIF\_RECOVERY\_STACK object. Its class number is 4 and its C-Type 1.

The OIF\_RECOVERY\_STACK object may be encoded in Path and Resv messages. At most one E-NNI\_RECOVERY\_STACK object should be contained in such messages. Subsequent E-NNI\_RECOVERY\_STACK object instances should be ignored.

The OIF\_RECOVERY\_STACK object contains one or more E-NNI recovery sub-object.

As detailed in section 6.7.1, the OIF\_RECOVERY\_STACK object is handled as a stack of E-NNI Recovery sub-object. One E-NNI Recovery sub-object is pushed on the stack every time the connection enters a nested recovery domain. The E-NNI Recovery sub-object is popped from the stack when the connection exits that recovery domain. When push on the stack, an E-NNI Recovery sub-object is added at the beginning of the OIF\_RECOVERY\_STACK object, as depicted below:

0	1	2		3						
0 1 2 3 4 5	6 7 8 9 0 1 2 3	4 5 6 7 8 9 0 1 2	2 3 4 5 6 7	8 9 0 1						
+-+-+-+-+	-+-+-+-+-+-+-+		-+-+-+-+-+	-+-+-+						
	-	Class-Num(4)								
		+-+-+-+-+-+-+-+-+- ery sub-object (N-		_+-+-+-+						
+-+-+-+-+-+	· +-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-									
1	E-NNI Recov	very sub-object (1	N)							
1										
+-+-+-+-+	-+-+-+-+-+-+-		-+-+-+-+-+	-+-+-+						
	E-NNI Recove	ery sub-object (N-	+1)							
		• • •								
+-+-+-+-+-+	-+-+-+-+-+-+-		-+-+-+-+-+	-+-+-+						

## E-NNI OTNv3 Amendment - RSVP-TE Signaling

The OIF\_RECOVERY\_STACK object MUST carry the same stack of E-NNI Recovery sub-objects in Path and Resv messages. Note that the E-NNI Recovery sub-object associated to a given recovery domain in the stack may be different in Path and Resv messages (some sub-sub-objects, e.g. in this Amendment, ASSOCIATION are not supported in the RECOVERY\_STACK of the Resv messages).

The E-NNI Recovery sub-object (TLV) for recovery domains scoped to a Routing Area has been assigned type 1. Its format is depicted below:

The E-NNI Recovery sub-object (TLV) for recovery domains scoped to an E-NNI interface has been assigned type 2. Its format is depicted below:

0	1	2		3
	5 7 8 9 0 1 2 3 4 5			
	·+-+-+-+-+-+-+-+-   Length (x)			
+-+-+-+-+-	Recovery F	-+-+-+-+-+-+ Domain source	+-+-+-+-+	-+-+-+

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

The fields are filled with the following values:

Recovery Domain Source (type 2 E-NNI Recovery sub-object only)

This field is set to the eNNI-U signaling controller ID.

Recovery Domain ID: 32 bits

The Recovery Domain ID field identifies the recovery domain to which the E-NNI Recovery sub-object is referring to (see E-NNI Recovery amendment).

In a type 1 E-NNI Recovery sub-object, it is set to a routing area ID.

In a type 2 E-NNI Recovery sub-object, it is set to a 32 bit integer assigned by the eNNI-U (identified in the Recovery Domain Source field).

(Domain Local) Service Level: 8 bits

This field specifies the desirable service expected from lower nested recovery domains. Its purpose is to help coordinating the recovery mechanisms chosen in multiple nested recovery domains.

It should be noted that the DIN of a nested domain (N), when receiving an OIF\_RECOVERY\_STACK object from its upstream peer in domain (N+1), should only consider the Service Level field of the first E-NNI Recovery sub-object (the latest added to the stack), in order to choose (policy-driven) a recovery mechanism in domain (N).

## ASSOCIATION object:

See section 6.3.11.3.2.

Encoding of the ASSOCIATION object within an E-NNI Recovery sub-object is mandatory in a Path message when an end-to-end recovery mechanism has been selected within a recovery domain boundary.

When no end-to-end recovery mechanism has been selected within a recovery domain boundary, but the DIN wants to enforce using links with a specific link-protection type, an E-NNI Recovery sub-object is required for that recovery domain (to specify that link-protection type in the PROTECTION object). However, in such a case, no ASSOCIATION object may be encoded.

It should not be encoded in a Resv message

## PROTECTION object:

See section 6.3.11.3.1.

# PRIMARY\_PATH\_ROUTE object:

See section 6.3.11.3.3

# 6.3.11.3.1 PROTECTION object

This amendment does not propose any change to the PROTECTION object defined in [RFC4872]. Its format is used without change. It is provided here for reference.

The format of the PROTECTION Object (Class-Num = 37, C-Type = 2) is as follows:

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

0	1	2	3							
0 1 2 3 4 5 6 7 8	9 0 1 2 3 4 5	6 7 8 9 0 1 2 3 4	5 6 7 8 9 0 1							
+-+-+-+-+-+-+-+-	+-+-+-+-+-+-+	-+-+-+-+-+-+-+-+	-+-+-+-+-+							
Length (12)   Class-Num(37)   C-Type (2)										
+-+-+-+-+-+-+-	+-									
S P N O  Reserved	LSP Flags	Reserved	Link Flags							
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-										
Reserved										
+-										

## Secondary (S): 1 bit

When set to 1, this bit indicates that the requested LSP is a secondary LSP. When set to 0 (default), it indicates that the requested LSP is a primary LSP.

## Protecting (P): 1 bit

When set to 1, this bit indicates that the requested LSP is a protecting LSP. When set to 0 (default), it indicates that the requested LSP is a working LSP. The combination, S set to 1 with P set to 0 is not valid.

# Notification (N): 1 bit

When set to 1, this bit indicates that the control plane message exchange is only used for notification during protection switching. When set to 0 (default), it indicates that the control plane message exchanges are used for protection-switching purposes. The N bit is only applicable when the LSP Protection Type Flag is set to either 0x04 (1:N Protection with Extra-Traffic), or 0x08 (1+1 Unidirectional Protection), or 0x10 (1+1 Bidirectional Protection). The N bit MUST be set to 0 in any other case.

## Operational (O): 1 bit

When set to 1, this bit indicates that the protecting LSP is carrying the normal traffic after protection switching. The O bit is only applicable when the P bit is set to 1, and the LSP Protection Type Flag is set to either 0x04 (1:N Protection with Extra-Traffic), or 0x08 (1+1 Unidirectional Protection) or 0x10 (1+1 Bidirectional Protection). The O bit MUST be set to 0 in any other case.

## Reserved: 5 bits

This field is reserved. It MUST be set to zero on transmission and MUST be ignored on receipt. These bits SHOULD be passed through unmodified by transit nodes.

#### LSP (Protection Type) Flags: 6 bits

Indicates the desired end-to-end LSP recovery type. A value of 0 implies that the LSP is "Unprotected". The following values are defined. All other values are reserved.

0x00	Unprotected
0x01	(Full) Rerouting
0x02	Rerouting without Extra-Traffic
0x04	1:N Protection with Extra-Traffic (not used in this implementation agreement)
0x08	1+1 Unidirectional Protection
0x10	1+1 Bidirectional Protection

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

Only one value SHOULD be set at a time. However, to support the combination of soft or hard-rerouting with 1+1 unidirectional or bidirectional protection, and with shared-mesh restoration, this implementation agreement allows the following values for the LSP Protection Type Flags:

0x09 Soft or hard-rerouting combination with 1+1 unidirectional protection

0x11 Soft or hard-rerouting combination with 1+1 bidirectional protection

0x03 Soft or hard-rerouting combination with shared-mesh restoration.

Reserved: 10 bits

This field is reserved. It MUST be set to zero on transmission and MUST be ignored on receipt. These bits SHOULD be passed through unmodified by transit nodes.

Link Flags: 6 bits

Indicates the desired link protection type (see [RFC3471]).

Reserved field: 32 bits

Encoding of this field is detailed in [RFC4873]. It SHOULD be set to zero on transmission and SHOULD be ignored on receipt. These bits SHOULD be passed through unmodified by transit nodes.

# 6.3.11.3.2 ASSOCIATION object

This amendment uses the Extended IPv4 ASSOCIATION object format defined in [RFC6780].

0	1	2	3						
0 1 2 3 4 5 6 7 8	9 0 1 2 3 4 !	5 6 7 8 9 0 1 2 3 4 5 6	7 8 9 0 1						
+-+-+-+-+-+-+-	+-+-+-+-+-+-	-+-+-+-+-	+-+-+-+-+						
Lengt	h	Class-Num(199)  C-Ty	ype (3)						
+-+-+-	+-+-+-+-+-+	-+-+-+-+-+-+-+-+-+-	+-+-+-+-+						
Association	n Type	Association ID							
+-+-+-+-+-+-+-	+-+-+-+-+-+	-+-+-+-+-	+-+-+-+-+						
IPv4 Association Source									
+-+-+-+-+-+-+-	+-+-+-+-+-+	-+-+-+-+-+-+-+-+-+-	+-+-+-+-+						
	Global Assoc	ciation Source							
+-+-+-+-+-+-+-	+-+-+-+-+-+	-+-+-+-+-+-+-+-+-+-	+-+-+-+-+						
:			:						
:	Extended As	ssociation ID	:						
:			:						
+-+-+-	+-+-+-+-+-+-	-+-+-+-+-	+-+-+-+-+						

The fields are filled with the following values:

Association Type: 16 bits

Indicates the type of association being identified. Note that this value is considered when determining association.

The Association Type MUST be set to 1 (Recovery; see section 6.7.2) or to 2 (Resource Sharing; see section 6.7.3).

Association ID: 16 bits

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

It carries an association identifier, which is assigned by the Association Source.

Association Source: 32 bits

Is set to the DIN controller SC PC ID.

Note that although this amendment specifies using the Extended IPv4 ASSOCIATION object format (i.e., 32 bits Association Source), it does not make any assumption about the SCN: it may be an IPv6 SCN.

Global Association Source: 32 bits

This field MUST be set to 0 for intra-carrier recovery scenarios (its usage for inter-carrier recovery scenarios is for further study).

Extended Association ID:

The extended association ID field MUST have a length of zero (it MUST be omitted).

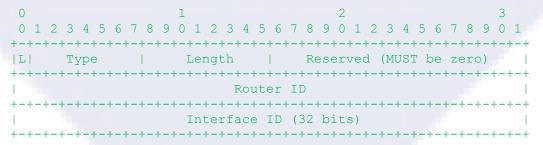

## 6.3.11.3.3 PRIMARY\_PATH\_ROUTE object

This amendment does not propose any change to the PRIMARY\_PATH\_ROUTE object defined in [RFC4872]. Its format is used without change. It is provided here for reference.

The format of the PRIMARY\_PATH\_ROUTE Object (Class-Num = 38, C-Type = 1) is as follows:

The contents of a PRIMARY\_PATH\_ROUTE object are a series of variable-length data items called subobjects.

The sub-objects of Type 3 (Label) defined in [RFC3473] and Type 4 (Unnumbered interface ID) defined in [RFC3477] MUST be supported in the E-NNI.

In the Type 4 (Unnumbered interface ID) sub-object, depicted above, the L bit, Router ID and Interface ID are set as specified in section 6.3.2.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

Type 3 sub-objects (Label) are not required in a PRIMARY\_PATH\_ROUTE object. They MAY be included e.g. when a PRIMARY\_PATH\_ROUTE object is built by duplicating a RECORD\_ROUTE object.

## 6.3.12 OIF VENDOR PRIVATE EXTENSION TYPE 3

OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_3 [OIF-RSVP-Ext] carries OIF\_LSP\_TUNNEL\_INTERFACE\_ID for signaling based discovery, OIF\_VENDOR\_PRIVATE\_ERO for multilayer ERO, OIF\_VENDOR\_PRIVATE\_RRO for multilayer RRO and OIF\_ML\_ADAPTATION for signaling adaptation information in the server layer.

## 6.3.12.1 OIF\_LSP\_TUNNEL\_INTERFACE\_ID

The OIF\_LSP\_TUNNEL\_INTERFACE\_ID should be used for signaling based discovery unless a distinct discovery protocol is used between the client layer endpoints. The OIF\_LSP\_TUNNEL\_INTERFACE\_ID MAY occur multiple times as a first level sub-TLV of the OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_3. Each occurrence represents a different set of client layers.

The OIF\_LSP\_TUNNEL\_INTERFACE\_ID format is indicated below. The length is variable.

0										1										2										3	
0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
+	+-+	+	+-+	+	+	+	H-H		+	+	+	+		+-+		+	+	+-+			+	+	+		+-+	<del>-</del> - +	+		+	+	-+
1						Le	eng	gth	1								C	las	ss-	-Nı	ım	(2)					2-5	ГУF	oe .	(1	.)

~									Se	eco	ono	l b	ie7	ve]		Sul	o – (	obj	jed	cts	3										~
+	+-+	+	+-+	+	+	+	H-+	+	+	+	+	+		+-+		+	+	+-+	+	+	+	+	+		+-+	<del>-</del> - +	<b>+-</b> -	H-+	+	-+	-+

The following second level sub-objects SHOULD be used for signaling based discovery unless a distinct discovery protocol is used between the client layer endpoints.

# Multi-Client second level sub-object

This second-level sub-object represents the set of client layers to which the first-level sub-object applies.

0	1	2	3
0 1 2 3 4 5 6 7 8 9	0 0 1 2 3 4 5	6 7 8 9 0 1 2 3 4	5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-	-+-+-+-+-+-+	+-+-+-+-+-+-+-	+-+-+-+-+-+-+
Length	1	Class-Num (1)	C-Type (1)
+-+-+-+-+-+-+-+-+-	-+-+-+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-+-+
Layer	Identifier		Reserved
+-+-+-+-+-+-+-+-+-	+-+-+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-+-+
~			~
+-+-+-+-+-+-+-+-+-	-+-+-+-+-+-+	+-+-+-+-+-+-	+-+-+-+-+-+-+
Layer	Identifier		Reserved
+-+-+-+-+-+-+-+-+-	-+-+-+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-+-+-+

Layer Identifier is defined in section 6.3.15.

CLIENT\_NODE\_ID\_IF\_ID second level sub-object

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

This second-level sub-object represents the node id and interface id(s) for the client layer(s) to which the first-level sub-object applies. A list of interface id(s) is included for the scenario where the VCAT constituents are established in the server layer using co-signaling approach that uses the multiplier (MT) (in SONET/SDH) value to establish multiple constituents. In this case, each constituent results in a separate client layer interface identifier in the list below.

0 1	2 3
	1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
Length	Class-Num (2)
Reserve	ed  A
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+++	-+
	Client Layer Node ID
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-++-	-+
	Client Layer Interface ID (32 bits)
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-++-	-+
~	~
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+	-+
	Client Layer Interface ID (32 bits)
+-+-+-+-+-+-+-+-+-+-	-+

A bit: When set to 1, indicates that the link is to be advertised in client layer routing.

## ASON Routing ID second level sub-object

This second-level sub-object represents the set of routing identifiers used by the client layers to which the first-level sub-object applies. C-Type 1 is for OSPF-TE based routing protocol with 32-bit RC PC ID and IPv4 RC PC SCN address.

0	1	2	3
0 1 2 3 4 5	6 7 8 9 0 1 2 3 4	1 5 6 7 8 9 0 1 2 3 4 5	5 6 7 8 9 0 1

## E-NNI OTNv3 Amendment – RSVP-TE Signaling

	Layer Identifier		Adaptation	
+-+-+-+-+-+-+-+-	+-	+-+-+-	-+-+-+-+-+	-+
~	Subobjects			~
+-+-+-+-+-+-+-	+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-++-	+-+-+-+-	_+_+_+_	-+

- OIF\_VENDOR\_PRIVATE\_RRO\_ID is filled with the same value specified in the OIF Vendor Private RECORD\_ROUTE sub-object.
- Type:
  - o 1: Nested
  - o 2: Inverse Multiplexing
- Layer Identifier represents the server layer. The format is defined in section 6.3.15.
- Adaptation is defined in section 6.3.16.
- Sub-objects consist of RRO sub-objects. The RRO subobjects are allowed to be of type OIF Vendor Private RECORD\_ROUTE. This allows the mechanism to recurse.

# 6.3.12.4 OIF\_ML\_ADAPTATION

The OIF\_ML\_ADAPTATION should be used for signaling which adaptation and client layer to use at the tail end of the server layer connection.

The OIF\_ML\_ADAPTATION format is indicated below.

0	1		2	3
0 1 2	3 4 5 6 7 8 9 0	1 2 3 4 5	6 7 8 9 0 1 2 3	4 5 6 7 8 9 0 1
+-+-+-	-+-+-+-+-+-	+-+-+-+-	+-+-+-+-+-+-	+-+-+-+-+-+-+-
	Length		Class-Num(5)	C-Type (1)
+-+-+-	-+-+-+-+-+-	+-+-+-+-	+-+-+-	+-+-+-+-+-+
1	Layer	Identifier		Adaptation
+-+-+-+	-+-+-+-+-+-+-	+-+-+-+-	+-+-+-+-+-+-+-	+-+-+-+-+-+-+-+

- Layer Identifier represents the client layer. The format is defined in section 6.3.15.
- Adaptation is defined in section 6.3.16.

For OTNv3, it may be necessary to identify more than one layer of ODU adaptations as there is no explicit identification of ODU layer transitions using transitional links. To support this, a second type of OIF ML ADAPTAION is defined.

The Type 2 OIF\_ML\_ADAPTATION format is indicated below.

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

0	1	2	3
0 1 2 3 4 5 6 7 8 9	0 1 2 3 4 5	6 7 8 9 0 1 2 3	3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+	-+-+-+-+-+	+-+-+-+-+-	-+-+-+-+-+-+-+
Length	I	Class-Num(5)	C-Type (2)
+-+-+-+-+-+-+-+-+	-+-+-+-+-+	-+-+-+-+-+-+	-+-+-+-+-+-+-+
Layer	Identifier		Adaptation
+-+-+-+-+-+-+-+-+-+	-+-+-+-+-+	-+-+-+-+-+-+-	-+-+-+-+-+-+-+
~			~
+-+-+-+-+-+-+-+-+-+-+	-+-+-+-+-+	-+-+-+-+-+-+-	-+-+-+-+-+-+
Layer	Identifier		Adaptation
+-+-+-+-+-+-+-+-+	-+-+-+-+-+	-+-+-+-+-+-+-	-+-+-+-+-+-+-+-+

The stack of layers is described from bottom to top. The first Layer Identifier represents the layer immediately above the server layer being signaled. The second Layer Identifier represents the layer on top of that layer, and so on.

The Type 2 OIF\_ML\_ADAPTATION object MUST only be used if there are two or more layers identified. If only one layer is to be signaled, then the Type 1 OIF\_ML\_ADAPTATION object MUST be used.

## 6.3.13 VCAT Labels

The Generalized Label Request for SONET/SDH VCAT has an Encoding Type value of 0x85 and a Switching Type of TDM (100) [RFC3471].

For all VCAT layer related label objects, the label format is as defined below:

A 32-bit label filled with 0xFFFFFFF.

## 6.3.14 CALL ID

The CALL\_ID format is defined in [RFC3474] with further clarifications provided in [OIF-UNI-02.0-R2-RSVP]. To guarantee uniqueness of the CALL\_ID across multiple domains and multiple layers, the Source LSR address type SHOULD be set to 0x7f (vendor-specific length) [RFC3474], the length SHOULD be 8 bytes and the LSR address SHOULD be filled as follows:

+-
LSP Enc. Type   Switching Type   Signal Type   Reserved
+-
SC PC ID
+-

For backwards compatibility in single layer applications, the source LSR address MAY be filled with the SC PC ID, using the appropriate LSR address type as described in [RFC3474].

# 6.3.15 Layer Identifier

A Layer Identifier appears in several sub-objects and is formatted as follows:

LSP Encoding Type is set as follows:

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

- For SONET/SDH, excluding VCAT: 5[RFC3471]
- For SONET/SDH VCAT: 0x85
- OTN (OTNv1 and OTNv3) ODUk: 12 (ODUk) [RFC4328]
- Ethernet EPL and EVPL: 2 (Ethernet) [RFC3471]

#### Switching Type is set as follows:

- SONET/SDH, OTNv1 ODUk, including VCAT: 100 (TDM) [RFC3471]
- OTNv3 ODUk: 110 (OTN-TDM) [RFC7139]

o SONET/SDH (excluding VCAT) server layer

- Ethernet EPL: 125 (DCSC) [RFC6002]
- Ethernet EVPL: 30 (EVPL) [RFC6004]

## Signal Type:

- SONET/SDH: see [RFC3946]
- OTN (OTNv1 and OTVn3) ODUk: see [RFC4328] and [RFC7139]
- VCAT, Ethernet EPL and EVPL: MUST be set to 0 and ignored upon receipt

# 6.3.16 Adaptation

Adaptation appears in several sub-objects and contains one of the following values, scoped by the server layer:

0	DOITE	178811 (cherading verit) serv	or ray or	
	0	GFP-F	0x01	
	0	GFP-T	0x02	
	0	VCAT (no LCAS)	0x03	
	0	VCAT (LCAS)	0x04	
O	SONE	Γ/SDH VCAT server layer		
	0	GFP-F	0x01	
	0	GFP-T	0x02	
O	OTN C	DDUk (where $k = 1,2,3,4$ ) serve	r layer	
	0	GFP-F	0x01	
	0	GFP-T	0x02	
	0	AMP	0x05	(including AMP-2.5G)
	0	BMP	0x06	
	0	AMP (1.25G)	0x07	
	0	GMP (1.25G)	0x08	
	0	GFP-F into Extended OPU2	0x09	
	0	PCS	0x0A	

## 6.3.17 OTNv3 Label Object

The following objects carry label information:

- GENERALIZED\_LABEL
- UPSTREAM\_LABEL
- LABEL\_SET
- ACCEPTABLE\_LABEL\_SET
- SUGGESTED\_LABEL

## E-NNI OTNv3 Amendment - RSVP-TE Signaling

- RECOVERY\_LABEL
- EGRESS\_LABEL sub-object of GENERALIZED\_UNI\_ATTRIBUTES
- SPC LABEL sub-object of GENERALIZED UNI ATTRIBUTES

For OTNv3 connections, the label format is as follows where the Class Number varies for the type of label (i.e. the GENERALIZED LABEL Class-Number is 16, UPSTREAM\_LABEL Class-Number is 35, LABEL\_SET Class-Number is 35, ACCEPTABLE\_LABEL\_SET Class-Number is 130, SUGGESTED\_LABEL Class-Number is 129, and RECOVERY\_LABEL Class-Number is 34).

0	1	2		3
0 1 2 3 4 5 6	5 7 8 9 0 1 2 3	4 5 6 7 8 9 0	1 2 3 4 5 6 7 8	9 0 1
+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+	+-+-+-+
	Length	C-Nu	m   C-Type	(2)
+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+-	+-+-+-+
TPN		Reserved	Bit Map Length	n
+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+-+	+-+-+-+
~	Bit Map		Padding Bits	~
+-+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-	+-+-+-+-+-+-+-+	+-+-+

TPN (12 bits): Indicates the HO-ODUk Tributary Port Number (TPN) that identifies the Tributary Slots used to support the requested OTNv3 LSP.

Reserved (8 bits): MUST be set to 0 and ignored upon receipt.

Bit Map Length (12 bits): Indicates the number of bits in the Bit Map field.

Bit Map (variable length): Identifies which HO-ODUk tributary slots will be used to support the requested OTNv3 LSP. Each bit of the Bit Map represents a tributary slot of the HO ODUk, starting with TS 1. A value of 1 indicates that the ODUk tributary slot is being used.

The size of the Bit Map depends on the bit rate and TSG of the HO-ODUk:

- HO-ODU1, 1.25G TSG: Bit Map Length = 2
- HO-ODU2, 1.25G TSG: Bit Map Length = 8
- HO-ODU2, 2.5G TSG: Bit Map Length = 4
- HO-ODU3, 1.25G TSG: Bit Map Length = 32
- HO-ODU3, 2.5G TSG: Bit Map Length = 16
- HO-ODU4, 1.25G TSG: Bit Map Length = 80

When the requested OTNv3 connection is an ODUk directly mapped into an OTUk, then the TPN MUST be set to 0, the Bit Map Length MUST be set to 0 and the Bit Map field SHALL NOT be present.

In case of signal multiplication, i.e., the multiplier field of the OTNv3 SENDER\_TSPEC is greater than one, an ordered list of labels MUST appear in the label object.

## 6.3.18 OTNv3 Generalized Label Request

The format of the GENERALIZED\_LABEL\_REQUEST object is defined in [RFC3473].

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

For OTNv3, a node MUST support the TDM-OTN Switching Type with a value of 110 and the G.709 ODUk (Digital Path) LSP Encoding Type with a value of 12 as defined in [RFC7139]:

0									1										2										3	
0	1 2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1	2	3	4	5	6	7	8	9	0	1
+-+	-+	+-+	-+	-+	+	+		+				+	+	+	+	+	+-+					+	+	+	+	+	+		+	+-+
1					Ι	Ler	ıgt	h								(	2-1	Jun	n	(19	9)		l	(	C-5	Тур	pe	( 4	1)	
+-+	-+	+-+	+	-+	+	+		+				+	+	+	+	+	+-+					+	+	+	+	+	+	+-+	+	+
E	nco	din	ıg	(1	2)		5	3W	Ty	/pe	9	(11	10)	)							(	G-1	PII	D						
+-+	-+	+-+	+	-+	+	+		+				+	+	+	+	+	+-+	H — H			<b></b> -	+	+	+	+	+	+	+-+	+	+-+

OTNv3 Encoding Type: 12 (ODUk) [RFC4328]

OTNv3 Switching Type: 110 (OTN-TDM) [RFC7139]

GPID: Refer to [RFC4328] and [RFC7139]

## 6.3.19 OTNv3\_TSPEC/OTNv3\_FLOWSPEC

For OTNv3 requests, the encoding of the OTNv3 SENDER\_TSPEC/FLOWSPEC follows [RFC7139]:

0 1	2 3
0 1 2 3 4 5 6 7 8 9 0 1 2	3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-	-+
Length	C-Num (12/9)   C-Type (7)
+-	-+
Signal Type	Reserved
+-	-+
NVC	Multiplier (MT)
+-	-+
T	Bit_Rate
+-+-+-+-+-+-+-+-+-+	-+

Signal Type: Identifies the type of Elementary Signal for the requested OTNv3 connection. The Signal Types supported for OTNv3 are:

- Signal Type = 1, ODU1
- Signal Type = 2, ODU2
- Signal Type = 3, ODU3
- Signal Type = 4, ODU4
- Signal Type = 10, ODU0
- Signal Type = 11, ODU2e
- Signal Type = 20, ODUflex(CBR)
- Signal Type = 21, ODUflex(GFP-F), resizable
- Signal Type = 22, ODUflex(GFP-F), non resizable

E-NNI OTNv3 Amendment - RSVP-TE Signaling

Reserved: MUST be set to 0 and ignored upon receipt.

NVC: Indicates the Number of Virtual Components (NVC). NVC is not used in this document and MUST be set to 0. (Virtual concatenation of ODU1, ODU2 and ODU3 is not supported).

MT: Indicates the Multiplier (MT). The Multiplier indicates the number of identical Elementary Signals that are requested for the OTNv3 connection. The usage of the MT field is defined in [RFC4328].

Bit Rate: Indicates the nominal bit rate of the ODUflex(CBR) or ODUflex(GFP) signal types. Bit rate is expressed in bytes per second encoded as a 32-bit IEEE single precision floating-point number. For ODUflex(CBR), the bit rate must account for the 239/238 factor and the transcoding factor, T. I.e., the ODUflex(CBR) nominal bit rate = CBR client bit rate \* (239/238) / T.

For signal types other than ODUflex(CBR) and ODUflex(GFP), the Bit Rate field MUST be set to 0.

# 6.4 RSVP-TE Signal Flows

RSVP-TE for E-NNI follows the signal flows specified in [OIF-ENNI2.0-SIG] Section 12. This section describes the RSVP-TE signal flows for connection setup, connection modification, and connection deletion.

# 6.4.1 Connection Setup

Figure 4 shows the setup of a connection across the E-NNI interface. Upon receiving a connection request from the network, the eNNI-U sends a Path message to the eNNI-D. The eNNI-D continues the setup request downstream. When the eNNI-D receives the setup response indication from the network, it generates a Resv message to the eNNI-U. Within the setup indication, the egress node can request an optional confirmation message. If the eNNI-U receives the confirmation from the network, it sends a ResvConf message to the eNNI-D. The eNNI-D continues to forward the confirmation to the egress.

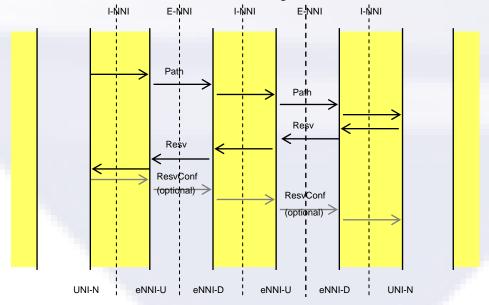

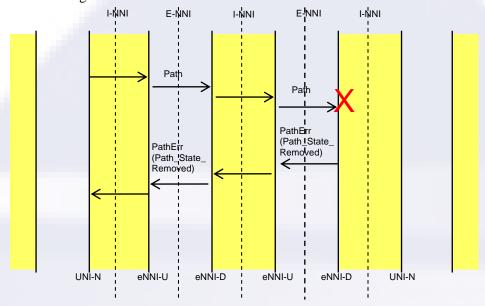

Figure 4: Basic Connection Setup Across the E-NNI

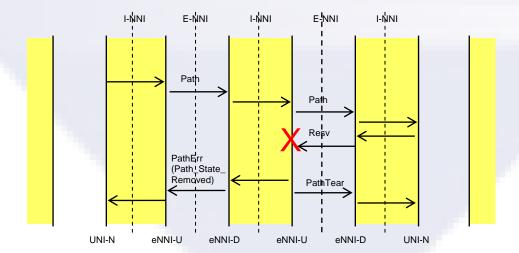

E-NNI OTNv3 Amendment – RSVP-TE Signaling

A connection setup can fail for a number of reasons including policy failure, inability to allocate resources, or destination not reachable. In the case that the eNNI-D fails the connection setup, or if the eNNI-D receives a connection setup failure indication from the network, it MUST delete its own path state and send a PathErr with the Path\_State\_Removed to the eNNI-U. The eNNI-U then forwards the connection failure indication towards the ingress node. This signal flow is shown in Figure 5.

**Figure 5: Connection Setup Failure** 

A connection setup can also fail during the indication (Resv) phase as shown in Figure 6. For instance, the label allocation can fail perhaps due to contention with another connection setup. In this case, the eNNI deletes its path state and generates PathErr with Path\_State\_Removed in the upstream direction and PathTear in the downstream direction.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

## **Figure 6: Connection Setup Failure during Indication**

If the Path\_State\_Removed flag is not set in the PathErr message, then the source UNI-C or UNI-N deletes the connection explicitly. This is shown in Figure 7. When the explicit teardown request reaches the eNNI, the eNNI-U sends PathTear to the eNNI-D. A node receiving a PathTear that does not match any path state MUST acknowledge the message if the PathTear carries a MESSAGE\_ID with the Ack\_Desired flag set and then discard the PathTear message.

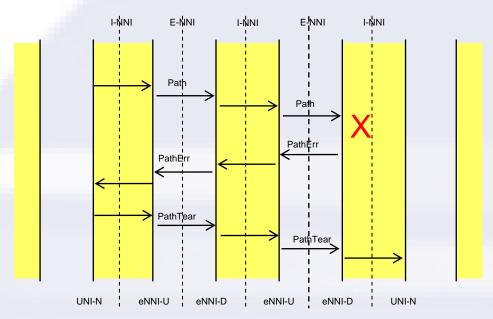

Figure 7: Connection Setup Failure without Setting the Path\_State\_Removed flag

#### 6.4.2 Call Modification

A call can be modified in three ways. First, a call can be modified by adding or removing a connection to an existing call. In this case, the connection modification procedures are not used. Instead, a new connection setup request or connection release request is issued. Connections being added may follow the same route as existing connections or may be diversely routed (follow different routes). Diverse routing of connections can only be accomplished by adding connections to an existing call. The second method is to modify an existing connection within a call. The third method consists of modifications in the client/server call relationship. For example, a client layer call may be modified by increasing the number of server layer calls associated with the client layer call in the 1:n client/server relationship, e.g. a VCAT call is modified from VC-4-5v to VC-4-6v by adding a VC-4 call to the server layer and modifying the adaptation. Another example is the m:1 relationship where the number of client layer calls using resources of the same server layer call may be changed, e.g. a 100Mbps Ethernet call is using resources from a STM-16 call, then another 100Mbps Ethernet call is added and sharing the resources from the same STM-16 call.

## 6.4.2.1 Call Modification by Adding and Removing Connections

Adding and removing connections to an existing call can be used to modify the bandwidth of a call. A failure to add or remove a connection does not impact other connections in the call. That is, the connections remain independent of each other within the call.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

Figure 8 shows a successful addition of a connection to an existing call. The call is established when the first connection is established. If the source subsequently wants to modify the call by adding another connection, it will generate a new Path message with the same CALL\_ID as in the existing connection. The presence of the CALL\_ID in a Path message for a new connection is used to infer that a connection is being added to the specified call. CALL\_ID is used to correlate the various connections at the E-NNI nodes. Upon receiving the call modification request for this scenario, the eNNI-U will generate a new Path message with the same CALL\_ID. This new Path message will have a different connection identifier (TUNNEL\_ID) and a new MESSAGE\_ID. If the E-NNI node does not have an existing call state for the received CALL\_ID, then the E-NNI node handles this as a new call setup request instead of a call modification.

Failure to add a connection to an existing call does not impact other connections because each connection has its own RSVP state.

The connection deletion message sequence is described in Section 6.4.3. Individual connections within a call can be deleted from the source, the destination, or from the network including from the E-NNI nodes. Each connection deletion is performed independently. A call without connections is not supported. Removal of the last connection results in the removal of the call state.

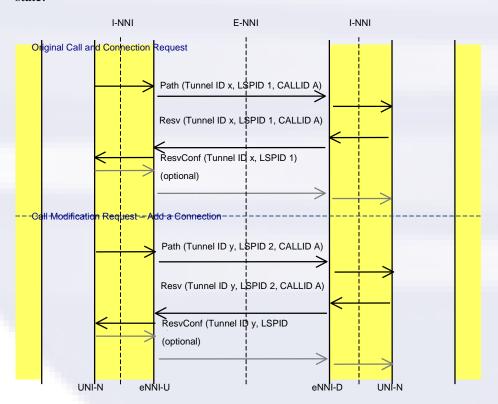

Figure 8: Successful Call Modification - Adding a Connection

# 6.4.2.2 Call Modification by Modification of an Existing Connection

E-NNI OTNv3 Amendment – RSVP-TE Signaling

In the second method, call modification can be supported by modifying an existing connection. E-NNI Signaling 2.0 supports the non-disruptive connection modification of the following service parameters:

- Bandwidth fields of the ETHERNET\_TSPEC/FLOWSPEC (CIR, CBS, EIR, or EBS) and/or the CE-VLAN ID mapping information
- Multiplier field of the SONET\_SDH\_TSPEC/FLOWSPEC, G709\_TSPEC/FLOWSPEC or OTNv3\_TSPEC/FLOWSPEC
- Number of members in VCAT call (OIF\_INV\_MUX\_TPSEC/FLOWSPEC)
- Bandwidth for VCAT (peak data rate of the INTSERV TSPEC/FLOWSPEC)
- Bandwidth field of the OTNv3\_TSPEC/FLOWSPEC (bit rate) for ODUflex(GFP) connections

To support connection modification, the original connection must have been established with the Shared Explicit (SE) reservation style. This allows two or more RSVP Path states to share the same resources (such as bandwidth or CE-VLAN ID information). An E-NNI 2.0 implementation that supports non-disruptive service parameter modification SHOULD request the SE reservation style in the SESSION\_ATTRIBUTE of the original Resv message. If the SE reservation style was not used in the Resv message, an E-NNI 2.0 node MUST NOT forward a non-disruptive connection modification. In this case, the E-NNI 2.0 node generates an error indication with the error code set to "Traffic Control Error: Service Unsupported".

A non-disruptive connection modification of a service parameter is illustrated in Figure 9. This same message flow is used to support modification of the bandwidth of an existing connection or modification of the CE-VLAN ID mapping to an EVC.

The call is established when the first connection is established. The eNNI-U sends a Path message to the eNNI-D to request call and connection creation. The Path request contains a SESSION\_ATTRIBUTE object with the SE Style request flag set. The CALL\_ID is set to the value received in the connection setup request received from the network. If a CALL\_ID was not present in the connection setup request, then the eNNI-U assigns a unique CALL\_ID object and adds it to the Path message (see Section 6.3.14). The eNNI-U also assigns a locally unique SESSION object for this connection and a unique LSP ID within the SENDER\_TEMPLATE scoped to the SESSION object.

If the eNNI-U receives a connection modification request for this connection, it must correlate the request to an existing connection. If the connection modification request contains a CALL\_ID for which there is no call state, then the eNNI-U sends an error indication "invalid/unknown call ID". Also, if there is no connection state, the eNNI-U sends an error indication "invalid/unknown connection ID". Once correlated, the eNNI-U continues the connection modification over the E-NNI. The eNNI-U generates a new Path message using the same SESSION object as the original connection but with a different LSP\_ID. This allows the original and new connections to share connection resources.

On receiving the connection modification indication, the eNNI-D generates a new Resv message in the reverse direction. This is achieved by generating a new Resv message for the new Path state. It contains the FILTER\_SPEC and labels of the corresponding Path message only. Continuing to refresh the previous Resv message, corresponding to the state that is awaiting teardown, until the PathErr with PATH\_STATE\_REMOVED flag set has been received is RECOMMENDED.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

The eNNI-U MUST send a new ResvConf message if it receives a modification confirmation from the network.

At this point, there should be a removal request from the network for the original connection. Upon receipt of the removal request from the network, the eNNI-U should generate a Path message for the original connection with the Delete and Reflect (D&R) bits set in the ADMIN\_STATUS object. This results in the graceful removal of the RSVP Path state at the eNNI-U and eNNI-D when the eNNI-D responds with a PathErr message with the PATH\_STATE\_REMOVED flag set.

The deletion of the original Path state causes the removal of the corresponding Resv state after the PathErr message with the PATH\_STATE\_REMOVED flag set has been received. Then the Resv corresponding to the deleted state will stop being refreshed.

# **OIF-ENNI-RSVP-02.3** E-NNI OTNv3 Amendment – RSVP-TE Signaling

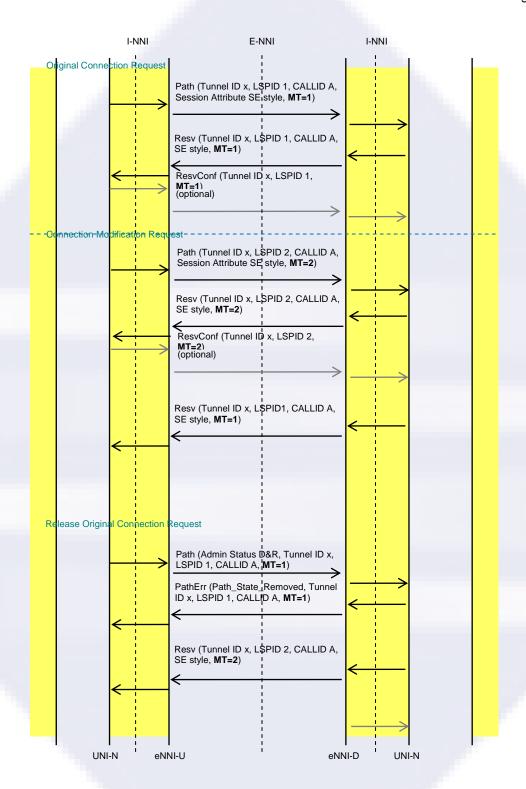

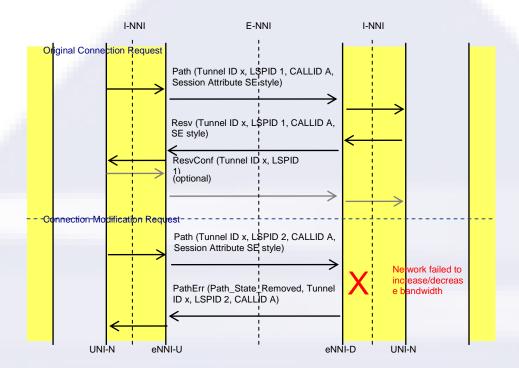

Figure 9: Successful Connection Modification

E-NNI OTNv3 Amendment - RSVP-TE Signaling

A failure to increase a connection bandwidth SHOULD result in a PathErr being sent for the Path message requesting more bandwidth. This MUST NOT impact the existing connections, other Path messages, or RSVP states. Figure 10 illustrates a failure to increase the bandwidth of a connection.

**Figure 10: Connection Modification Failure** 

A bandwidth decrease can be achieved with an identical message flow, although the ResvConf message may not be necessary in this case. The new bandwidth becomes effective at the PathErr stage as opposed to the ResvConf message stage. A failure to decrease a connection bandwidth SHOULD result in a PathErr being sent for the Path message requesting less bandwidth. This MUST NOT impact the existing connections, other Path messages, or RSVP states.

## 6.4.2.3 ODUflex(GFP) Hitless Resize

ODUflex hitless resizing supports the ability to resize the bandwidth of an ODUflex(GFP) connection without impacting traffic. Bandwidth increase and decrease are supported. The ODUflex hitless resizing follows the bandwidth adjustment procedure for modifying an existing connection as described in Section 6.4.2.2.

To support hitless resizing, the original ODUflex(GFP) connection must have been established with the Shared Explicit (SE) reservation style. Make-before-break signaling is used to adjust the bandwidth. The new connection with updated bandwidth is signaled with the same RSVP tunnel ID as the original connection but a different LSP ID. The SE style allows the sharing of resources (in this case tributary slots) between the original connection and the new connection.

The signaling for hitless bandwidth increase of ODUflex(GFP) is shown in Figure 11. The original connection was established with rate R1 (equivalent of N1 tributary slots). A new

# E-NNI OTNv3 Amendment - RSVP-TE Signaling

connection with the same Tunnel ID but different LSP ID is signaled requesting rate R2 (equivalent of N2 tributary slots) where R2>R1. At least one tributary slot worth of bandwidth must be added. Because the SE style was used, the tributary slots on the original connection are reused. The additional N2-N1 tributary slots to support the higher rate R2 are assigned and allocated during the Resv message exchange of the second connection.

The Resv message also triggers the transport plane hitless resize procedure for bandwidth increase. Once the transport plane has completed the bandwidth increase procedure at the ingress node, the original connection is released. The original connection can be released using a two-pass graceful teardown procedure (Path D&R followed by PathErr with Path\_State\_Removed) or using a one-pass PathTear. A notification may be sent to the management system indicating that the hitless bandwidth increase operation has completed. For the case where the resize operation was triggered by a client layer request in a multilayer scenario, the ODUflex server layer indicates completion to the client layer.

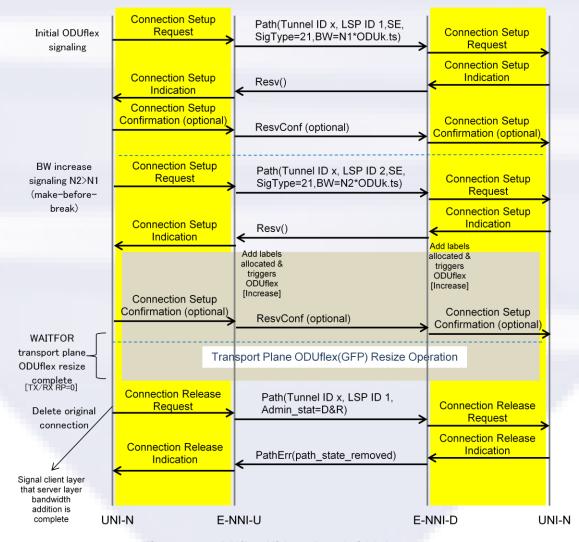

Figure 11: ODUflex Hitless Bandwidth Increase

E-NNI OTNv3 Amendment - RSVP-TE Signaling

Figure 12 continues the example to show bandwidth decrease. A reduced bandwidth rate of R3 (equivalent of N3 tributary slots) is requested where R3<R2. Again, because the SE style is being used, N3 tributary slots from the established connection are reused. The N2-N3 tributary slots to be removed are identified during the Resv message exchange. Note that the highest numbered tributary slot cannot be removed as its overhead supports the GMP mapping parameters.

The Resv message triggers the transport plane hitless resize procedure for bandwidth decrease. Once the transport plane has indicated that the bandwidth decrease procedure has completed at the ingress node, the previously established connection is released. As in the bandwidth increase case, the previously established connection can be released using a two-pass graceful teardown procedure or a one-pass PathTear. A notification may be sent to the management system indicating that the hitless bandwidth decrease operation has completed. For the case where the resize operation was triggered by a client layer request in a multilayer scenario, the ODUflex server layer indicates completion to the client layer.

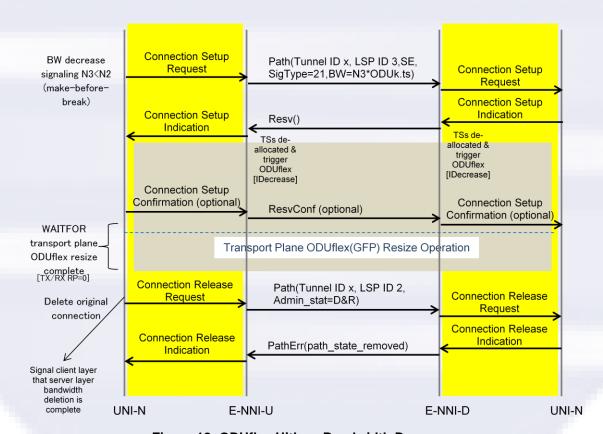

Figure 12: ODUflex Hitless Bandwidth Decrease

# 6.4.2.4 VCAT Layer Call Modification Details

There are a few restrictions that apply to the modification of VCAT layer calls. The ordering of the members, i.e. server layer calls, MUST be preserved. When increasing VCAT layer bandwidth, new members MUST be added after existing members. For bandwidth decreases, any member may be removed but remaining members must maintain the original order. For

E-NNI OTNv3 Amendment - RSVP-TE Signaling

simplicity, each call modification signaling sequence MUST be limited to either an increase or a decrease.

## 6.4.3 Connection Deletion

## 6.4.3.1 Graceful Connection Deletion Initiated from the Source or Destination

RSVP allows for deletion of connections using either a single pass PathTear message, or a ResvTear and PathTear message combination. Upon receipt of the PathTear message, a node deletes the connection state and forwards the message. In optical networks, however, it is possible that the deletion of a connection (e.g., removal of the cross-connect) in a node may cause the connection to be perceived as failed in downstream nodes (e.g., loss of frame, loss of light, etc.). This may in turn lead to management alarms and perhaps the triggering of restoration/protection for the connection.

To address this issue, the graceful connection deletion procedure MUST be followed. Under this procedure, an ADMIN\_STATUS object with the D-bit set MUST be sent in a Path or Resv message along the connection's path to inform all nodes enroute of the intended deletion, prior to the actual deletion of the connection. The procedure is described in [RFC3473] and shown in Figure 13 and Figure 14.

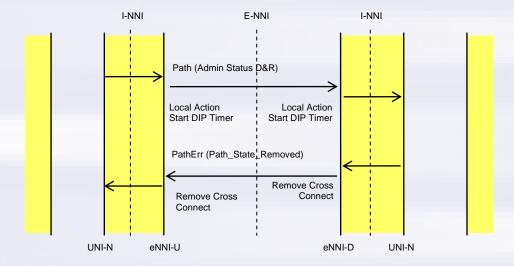

Figure 13: Connection Teardown Initiated by the Source

E-NNI OTNv3 Amendment – RSVP-TE Signaling

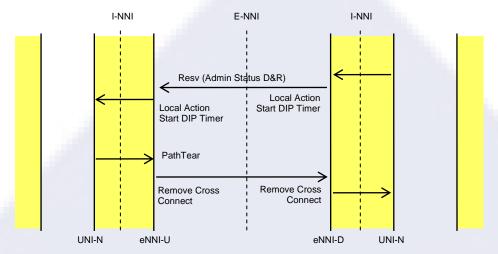

Figure 14: Connection Teardown Initiated by the Destination

## 6.4.3.2 Graceful Connection Deletion Initiated from the Network

A graceful deletion may also be initiated within the network. In this case, the eNNI-D may receive a connection deletion notification from the network. It is also possible that the eNNI-D can initiate a graceful deletion. In E-NNI Signaling 1.0, the network-initiated graceful deletion notification was signaled via the Path or Resv message with the A&R bits set. The signaling of graceful deletion is changed to use the Notify message in E-NNI Signaling 2.0 to align with [RFC3473].

# 6.4.3.2.1 Notify Message Support

The Notify message MUST be supported. In E-NNI Signaling, the Notify message is used to signal a connection deletion initiated from an E-NNI or network node. It is also used for recovery.

An eNNI-U node MUST include the NOTIFY\_REQUEST object in the Path message sent to the eNNI-D. Likewise, an eNNI-D node MUST include the NOTIFY\_REQUEST object in the Resv message to the eNNI-U. The Notify Node Address field of the NOTIFY\_REQUEST object is set to the SC PC ID of the node generating the object.

When an E-NNI node needs to generate a Notify message, it targets the message to the SC PC ID associated with the Notify Node Address received in the incoming Path or Resv message. All session-specific objects SHALL be set to the appropriate values for the E-NNI connection segment.

An E-NNI node MUST NOT generate a Notify message to a signaling controller from which it did not receive a NOTIFY\_REQUEST object. In addition, an E-NNI node SHOULD NOT generate a Notify message if it received a NOTIFY\_REQUEST object but the Notify Node Address does not match its neighbor's SC PC ID.

## 6.4.3.2.2 Network Initiated Graceful Deletion

An E-NNI node MUST support the ability to forward a network initiated graceful deletion notification across the E-NNI interface. In addition, an E-NNI node MAY support the ability to initiate a graceful deletion notification. Network initiated graceful deletion is signaled across the E-NNI 2.0 interface using the Notify message instead of using the Path or Resv message with the ADMIN\_STATUS A&R bits set.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

An eNNI-D node initiates, or forwards, a graceful deletion notification by sending a Notify message to the eNNI-U. The graceful deletion Notify message contains the ADMIN\_STATUS object with the D bit set. The eNNI-D also sends the graceful deletion Notify message when it receives a graceful deletion notification from the network.

In E-NNI Signaling 2.0, the graceful deletion notification SHOULD always be sent upstream to the source node. Upon receipt, the source node initiates the normal graceful deletion procedures as specified in [OIF-UNI-02.0]. The signal flow for a network initiated graceful deletion is shown in Figure 15.

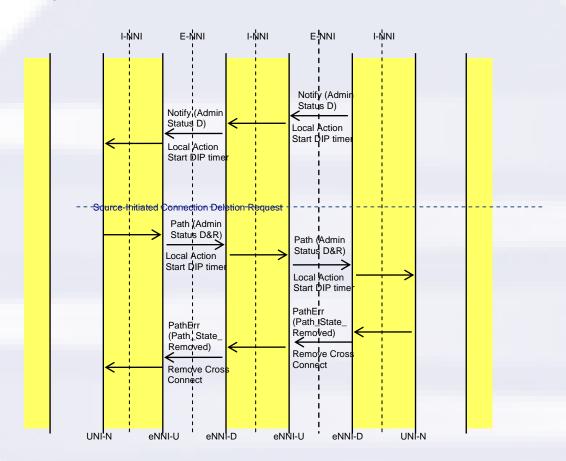

Figure 15: Connection Teardown Initiated by the eNNI-D

# 6.4.3.2.3 E-NNI Signaling 1.0 Compatibility

An E-NNI 2.0 node MUST NOT send the Notify message for a graceful deletion notification if its neighbor only supports E-NNI Signaling 1.0. Instead, the E-NNI 2.0 node MUST send a Path or Resv message containing the ADMIN\_STATUS object with the A&R bits set to signal network graceful deletion.

An E-NNI 2.0 node determines its neighbor's E-NNI version support either by manual configuration or through an automatic discovery process. An E-NNI node MAY assume the neighbor is running E-NNI 1.0 Signaling if it does not receive a NOTIFY\_REQUEST object or if

E-NNI OTNv3 Amendment - RSVP-TE Signaling

the NOTIFY\_REQUEST object is received but the Notify Node Address is not equal to the neighbor's SC PC ID.

E-NNI Signaling 1.0 also allows for graceful deletion notifications in the downstream direction. In this case, the eNNI-U SHOULD signal the downstream graceful deletion to an E-NNI 2.0 compliant eNNI-D by using the Notify message containing the ADMIN\_STATUS object with the D bit set. Otherwise, it SHOULD send a Path message with the A&R bits set in the ADMIN\_STATUS object if the eNNI-D is E-NNI 1.0 compliant.

## 6.4.3.3 Forced Deletion

An E-NNI node SHOULD support the ability to initiate a forced deletion of a connection. A forced deletion may be necessary to react to events such as:

- Internal network failures, which force the network to terminate connections
- When the "Deletion In Progress" timer object expires

An eNNI-U node initiates a forced deletion by deleting its RSVP states and removing the cross connect. It then sends a PathTear message downstream to the eNNI-D while at the same time signaling a forced deletion in the upstream direction. The eNNI-D, upon receipt of the PathTear message, deletes its RSVP states and removes the cross connect. The eNNI-D continues the signaling of the forced deletion in the downstream direction. This signal flow is shown in Figure 16.

Figure 17 shows a forced deletion initiated by an eNNI-D node. In this case, the eNNI-D deletes its RSVP states and removes the cross connect. The eNNI-D then signals the forced deletion by sending a PathErr message with the "Path\_State\_Removed" flag set to the eNNI-U and simultaneously signals a forced deletion in the downstream direction. The eNNI-U will delete its RSVP states and remove the cross connect when it receives the PathErr message. The eNNI-U will continue to propagate the forced deletion signal upstream through the network.

It is also possible that the network may generate a forced deletion signal. When an eNNI-U receives the forced deletion signal from the upstream network, it deletes the RSVP states, removes the cross connect, and signals PathTear to the eNNI-D. Likewise, if an E-NNI-D receives a forced deletion signal from the downstream network, it deletes the RSVP states, removes the cross connect, and signals PathErr with the "Path\_State\_Removed" flag set to the eNNI-U.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

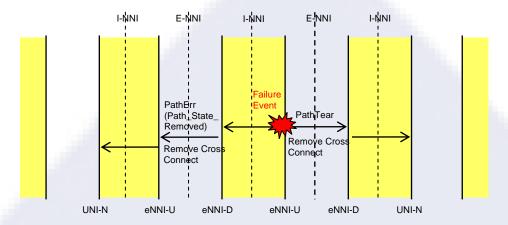

Figure 16: Forced Deletion Initiated by an eNNI-U

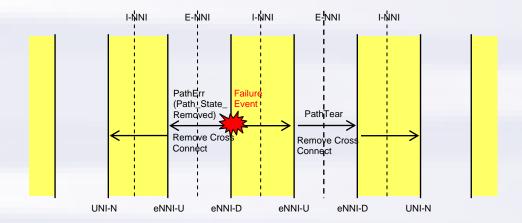

Figure 17: Forced Deletion Initiated by an eNNI-D

# 6.4.4 Additional RSVP-TE Messages

In addition to the signal flows described in [OIF-ENNI2.0-SIG] Section 12, RSVP-TE provides the ACK message. This message is only transmitted between eNNI-U and eNNI-D and may be used:

• To obtain an acknowledgement for sent messages. The acknowledgement function can be provided either directly, using the Ack message, or indirectly (via MESSAGE\_ID\_ACK) when the sent message has a corresponding reply message (that is immediately generated) on a specific link (e.g., Resv/PathErr is Path's corresponding reply message). Figure 18 illustrates an additional ACK for the case of connection setup.

# **OIF-ENNI-RSVP-02.3** E-NNI OTNv3 Amendment – RSVP-TE Signaling

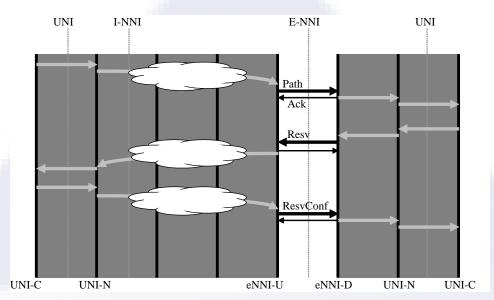

Figure 18: Basic SC Setup Using RSVP-TE

RSVP-TE also defines Hello and Srefresh messages. Both messages have local scope and are specific to the RSVP-TE protocol. The Hello message may be used:

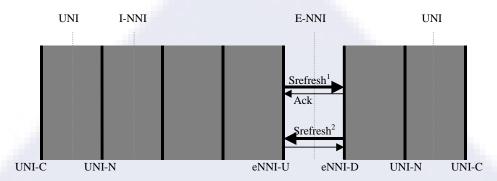

- to ensure an RSVP session is up (using request and acknowledge objects)
- to initiate restart procedures by exchanging recovery and restart timers

The Srefresh message may be used:

• to refresh RSVP-TE state without the transmission of Path or Resv messages. This reduces the amount of information that must be transmitted and processed to maintain connection state synchronization. A Srefresh message carries a list of Message\_Identifier fields corresponding to the Path and Resv trigger messages that established the state. Message\_Identifier fields are carried in a MESSAGE\_ID\_OBJECT. Figure 19 illustrates an example of Srefresh used to refresh Path and Resv states.

## OIF-ENNI-RSVP-02.3 E-NNI OTNv3 Amendment – RSVP-TE Signaling

**Note 1:** This Srefresh may be used to refresh both Path and Resv state information associated with all connections from eNNI-U to eNNI-D.

**Note 2:** This Srefresh may be used to refresh both Path and Resv state information associated with all connections from eNNI-D to eNNI-U.

Figure 19: Basic Srefresh Signaling

## 6.5 RSVP-TE Control Plane Failures

# 6.5.1 RSVP-TE Signaling Channel Failure

As described in [OIF-ENNI2.0-SIG] Section 12.2.4, the failure of a signaling channel or control protocol entities MUST NOT result in the deletion of previously established connections. The handling of control state failure (without loss of the forwarding state) is described in [RFC3473] through the support of the RESTART\_CAP object<sup>5</sup>, which requires the use of Hello messages. Here, in particular, a node MUST support the fault handling procedure described in Section 9 of [RFC3473].

In addition to the behaviors described in [OIF-ENNI2.0-SIG] Section 12.2.4, RSVP-TE requires an exchange of messages to synchronize the states of established connections. During a signaling channel failure, a self-refresh procedure is executed to prevent state information from expiring. After recovery from the failure, the neighboring control entities initiate an exchange of Hello messages. The Hello messages are used to trigger the process of synchronizing (or recovering) the states of established connections. This ensures that the states of established connections remain consistent. The following local behaviors apply to nodes impacted by the signaling channel failure:

- A control plane node detecting a signaling channel failure should inform the management system of the failure. The default (control plane) behavior is to enter self-refresh of the call/connection states. The management system may give the control plane specific instructions to override the default behavior, for example, to release certain connections. As an example, possible management system instructions may be to remain in self-refresh mode, or to release certain connections.
- A control plane node (NCC or CC) detecting that one (or more) connections cannot be synchronized with its neighbor (e.g., due to different states for the call or connection) should inform the management system. The default behavior of the control plane should

www.oiforum.com 71

-

<sup>&</sup>lt;sup>5</sup> To support the requirement that a control plane failure does not affect established connections, the Restart Time used in the RESTART\_CAP object of the Hello message MUST be set to 0xffffffff. Note that local policy or configuration rules that are set based on management input may override the values specified by the Restart Time.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

be to retain the connection unless explicitly instructed to release the connection by an external entity. As an example, possible management system instructions may be to delete the connection. Specifics of the interactions between the control plane and management plane are outside the scope of this document.

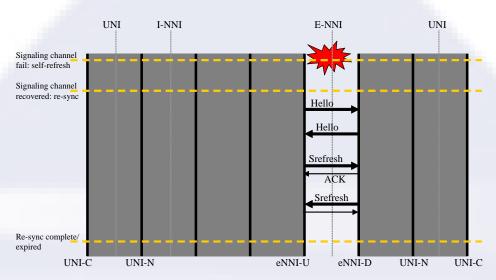

Figure 20: Recovery from Signaling Channel Failure

To ensure RSVP Hellos are supported, a node MUST NOT accept any call request unless a successful control adjacency has been established. A PATH message received from a node that has not sent any Hello message yet MAY be used to trigger the Hello procedure. A node SHOULD respond to unexpected or erroneous Hello messages by setting the Dst\_Instance to 0 in the Hello Request or HelloAck object, which indicates that the received message is not accepted.

## 6.5.2 RSVP-TE Control Plane Failure

In addition to the behaviors described in [OIF-ENNI2.0-SIG] Section 12.2.4, RSVP-TE requires a message exchange to synchronize the states of established connections. During a control plane node (CC) failure, a self-refresh procedure is executed to prevent state information from expiring. After recovery from the failure, the recovered node (CC) must attempt to restore the state information of established connections from its local persistent storage [G.7713.2]. Subsequent to this, the neighboring control entities initiate exchanges of Hello messages. The Hello messages are used to trigger synchronizing (or recovering) the states of established connections. This ensures that the states of established connections remain consistent. Thus the following local behaviors can be envisioned for handling control plane node (CC) failure:

A control plane node (NCC/CC) must provide for persistent storage of call and connection state information. This allows each control plane node (NCC/CC) to recover the states of calls or connections after recovery from a signaling controller entity failure or reboot (or loss of local state in memory). Note that although the restart mechanism allows neighboring control plane nodes (NCCs/CCs) to recover (and thus infer) the states of calls or connections automatically, this mechanism can be used to verify neighbors' states while the persistent storage provides the local recovery of lost state. In this case, per [RFC3473], if during the Hello synchronization the restarting node (NCC/CC) determines that a neighbor does not support state recovery, and the restarting node

E-NNI OTNv3 Amendment – RSVP-TE Signaling

(NCC/CC) maintains its state on a per neighbor basis, the restarting node (NCC/CC) should immediately consider the Recovery to be complete.

- A control plane node (NCC/CC) detecting that one (or more) connections cannot be synchronized with its neighbor (e.g., due to different states for the call or connection) should inform the management system. The default behavior of the control plane should be to retain the connection unless explicitly instructed to release the connection by an external entity. The management system may give the control plane further instructions on how to handle the non-synchronized connection. As an example, possible management system instructions may be to delete the connection. Specifics of the interactions between the control plane and management plane are outside the scope of this document.
- A control plane node (NCC/CC), after recovering from node failure, may not be able to recover neighbor forwarding adjacency information from its local persistent storage and thus may lose information on forwarding adjacencies. In this case the control plane node (NCC/CC) should query an external controller (e.g., the management system) for information to recover the forwarding adjacency information. Specifics of the interactions between the control plane and management plane are outside the scope of this document.

## 6.6 Security Note

Note that using the security attribute defined in [G.7713] or the RSVP INTEGRITY object described in [RFC2747] (which is updated by [RFC3097]) for securing the OIF Control Plane is NOT RECOMMENDED because the [G.7713] security attribute is not specifically defined, and the RSVP INTEGRITY object:

- only covers one protocol. A single security solution for all Control Plane protocols is desired.
- does not provide the required confidentiality service or any automated method for exchanging and updating keys.
- specifies MD5 as its only security transform, and MD5, as a hash function, is now considered a weak mechanism.

The rationale given in [RFC2747] for rejecting IPsec does not apply to RSVP-TE as used in the OIF Control Plane.

## 6.7 Call/Connection Recovery

This amendment proposes re-using the PROTECTION and the ASSOCIATION objects (defined in [RFC4872] and [RFC6780]) to specify respectively the recovery type information and the association information.

OIF RSVP E-NNI signaling is used to convey these two objects between recovery domains and, in the case of nested recovery domains, within the larger recovery domain between nested recovery domains.

## 6.7.1 Recovery mechanism-independent signaling

## 6.7.1.1 Source and destination UNI-Ns belong to the recovery domain

E-NNI OTNv3 Amendment - RSVP-TE Signaling

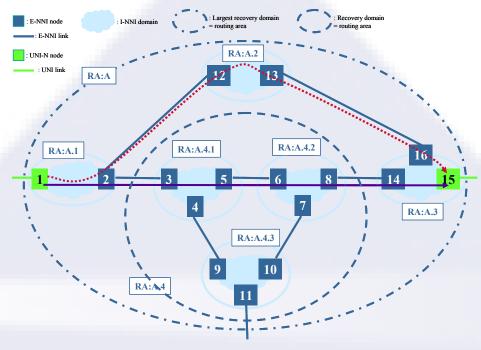

Figure 21: Example of recovery connection between source and destination UNI-Ns

When both the source and destination UNI-Ns belong to the same recovery domain<sup>6</sup>, the source UNI-N may choose a recovery mechanism for the new call.

If the UNI-N node has received an UNI request, it should look at the G-UNI Service Level subobject and refer to its local policy to map the service level to one (or several) recovery mechanism(s).

This mechanism is considered an end-to-end recovery mechanism.

The Path message for the working connection will carry an ASSOCIATION object and a PROTECTION object. Both objects refer to whatever recovery mechanism has been selected by the source UNI-N.

The Path message for the recovery connection will carry an ASSOCIATION object and a PROTECTION object too. The ASSOCIATION object specifies exactly the same values as the ASSOCIATION object used in the working connection Path message.

In both cases, the ASSOCIATION and PROTECTION objects are encapsulated in an E-NNI recovery sub-object contained in the OIF\_RECOVERY\_STACK object.

When the working or recovery connections Path message enters nested recovery domains, these two (end-to-end) ASSOCIATION and PROTECTION objects are carried unchanged within and across those domains.

Section 6.7.1.3 then applies for subsequent messages processing.

#### 6.7.1.2 Signaling in the largest recovery domain

www.oiforum.com 74

\_

<sup>&</sup>lt;sup>6</sup> This may not be the case when the two UNI-Ns belong to different carriers that have no common recovery service level agreement (in such a case, the largest recovery domains would be contained uniquely within each carrier network).

E-NNI OTNv3 Amendment - RSVP-TE Signaling

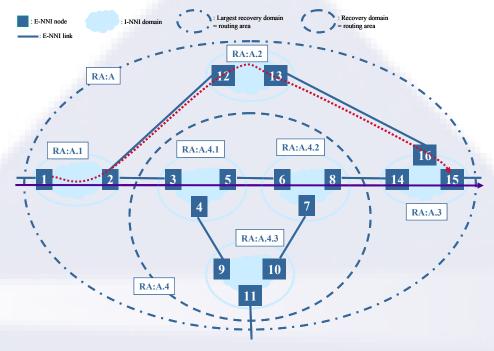

Figure 22: Example of recovery connections in largest recovery domain

When the DIN from the largest recovery domain receives an E-NNI connection request (Path message) from outside that domain:

- It MUST discard and ignore, if any, all set of recovery information received (PROTECTION, ASSOCIATION, OIF\_RECOVERY\_STACK ...objects);
- It should look at the G-UNI Service Level sub-object and refer to its local policy to map the service level to one (or several) recovery mechanism(s).
- Add an ASSOCIATION object and a PROTECTION object as per section 6.7.1.1. (first E-NNI Recovery sub-object in the OIF\_RECOVERY\_STACK object).

Section 6.7.1.3 then applies for subsequent messages processing.

## 6.7.1.3 Signaling in a nested recovery domain

E-NNI OTNv3 Amendment – RSVP-TE Signaling

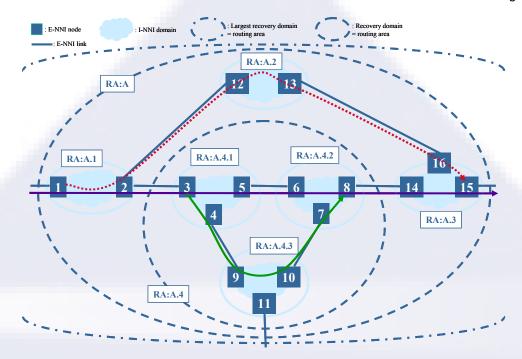

Figure 23: Example of recovery connections in nested domains

### 6.7.1.3.1 Path message processing - DIN

When a DIN receives a Path message, it checks whether an OIF\_RECOVERY\_STACK object is present.

- If there is none, it looks at the G-UNI Service Level sub-object and refers to its local policy to map the service level to one recovery mechanism, or none.
  - If a recovery mechanism has been selected, it adds an ASSOCIATION object and a PROTECTION object as per section 6.7.1.1. (first E-NNI Recovery sub-object in the OIF\_RECOVERY\_STACK object).
- If there is one, it looks at the first E-NNI Recovery sub-object (the latest sub-object added in the stack) domain local service level and refer to its local policy to map the domain local service level to one (or several) recovery mechanism(s), or none.
  - If a recovery mechanism has been selected, it adds an ASSOCIATION object and a PROTECTION object in a new E-NNI Recovery sub-object. Its domain local service level is set appropriately. This sub-object is pushed in the OIF\_RECOVERY\_STACK object (i.e., it becomes the first E-NNI Recovery sub-object, see section 6.3.11.3).

Note that if a node is a DIN for multiple nested recovery domains, and one recovery mechanism is selected in each domain, he may push multiple E-NNI Recovery sub-objects in the OIF\_RECOVERY\_STACK object.

### 6.7.1.3.2 Path message processing - DEN

When a DEN receives a Path message, it checks whether an OIF\_RECOVERY\_STACK object is present, and whether the first E-NNI Recovery sub-object identifies its local recovery domain.

## E-NNI OTNv3 Amendment – RSVP-TE Signaling

• If such E-NNI Recovery sub-object is found, it pops this sub-object from the OIF\_RECOVERY\_STACK object.

Note that if a node is a DEN for multiple nested recovery domains, he may pop multiple E-NNI Recovery sub-objects from the OIF RECOVERY STACK object.

## 6.7.1.3.3 Resv message processing - DEN

When a DEN receives a Resv message for a connection for which a recovery mechanism was selected in its local domain, it pushes a new E-NNI Recovery sub-object in the OIF\_RECOVERY\_STACK object (i.e., it becomes the first E-NNI Recovery sub-object, see section 6.3.11.3).

Note that if a node is a DEN for multiple nested recovery domains, he may push multiple E-NNI Recovery sub-objects in the OIF\_RECOVERY\_STACK object.

### 6.7.1.3.4 Resv message processing - DIN

When a DIN receives a Resv message, it checks whether an OIF\_RECOVERY\_STACK object is present, and whether the first E-NNI Recovery sub-object identifies its local recovery domain.

• If such E-NNI Recovery sub-object is found, it pops this sub-object from the OIF\_RECOVERY\_STACK object.

Note that if a node is a DIN for multiple nested recovery domains, he may pop multiple E-NNI Recovery sub-objects from the OIF\_RECOVERY\_STACK object.

## 6.7.2 Connections association for recovery purpose

[RFC6780] ASSOCIATION object allows associating LSPs belonging to different RSVP-TE sessions based on its association type, its association source and its association identifier.

In ASON networks, an ASSOCIATION object will be carried across E-NNI interfaces through multiple domains. Consequently:

• The association source and identifier must be independent from the RSVP SESSION and SENDER\_TEMPLATE object fields, since they change across each E-NNI (using the LSPID as in [RFC6780] is not possible);

When a Path message is received for the recovery connection, CCs inside of the recovery domain need to be able to identify if they are DEN of the recovery domain, and should act accordingly. If they are not, then the signaling should progress through the CC towards the actual DEN.

In case of restoration, it is possible the network topology causes a restoration path to intersect the original path at a point other than the restoration domain border egress node. An example network topology is shown in Figure 24, where Node B is involved in the original path (A-B-Z) as well as the restoration path (A-E-B-F-Z). In this case, when the signaling for the restoration path enters node B, it should continue on to the domain egress node, Node Z, through Node F, without any special operation (note that in Figure 24 example, the DIN - Node A - chose not to reuse any resource upstream or downstream to Node B).

E-NNI OTNv3 Amendment – RSVP-TE Signaling

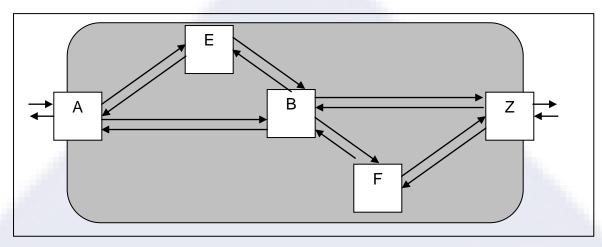

Figure 24: Original and restoration path cross prior to domain egress

For recovery domains scoped to a routing area, a node will identify that it is the recovery domain DEN of a working or recovery connection if the connection downstream link leaves the recovery domain (see also section 6.7.2.1 that requires the specification of the E-NNI exit link in a recovery connection Explicit Route).

## 6.7.2.1 Recovery connection endpoint for a transit recovery domain

This section does not apply to E-NNI-scoped recovery domains.

The working and recovery connections of a transit recovery domain must exit this transit recovery domain (i.e. a domain where the destination TNA is not located) through the same physical node. Therefore, the recovery connection Explicit Route MUST specify the transit domain exit E-NNI link. In case of abstraction, the recovery connection will then be routed to the same physical exit node as the working connection, as shown in Figure 25.

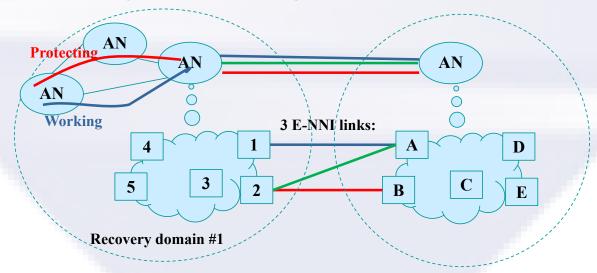

Figure 25: Recovery connection endpoint (transit recovery domain)

## 6.7.2.2 Recovery connection endpoint for the destination recovery domain

E-NNI OTNv3 Amendment – RSVP-TE Signaling

In the destination recovery domain, the working and recovery connections must terminate on the same physical node, which is identified by the destination TNA. In case of abstraction, as shown in Figure 26 for instance, no ERO is specified in the Path message received by the signaling controller in charge of the final abstract node (AN8), the recovery connection is then be routed thanks to the destination TNA.

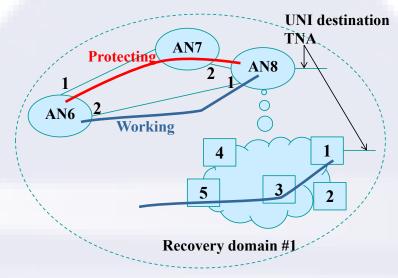

Figure 26: Recovery connection endpoint (destination recovery domain)

#### 6.7.3 Resource re-use

Resource re-use across an E-NNI link can be achieved by using RSVP SE reservation style and having the recovery connection using the same Tunnel ID as the working connection. This mechanism does not allow resource re-use within I-NNI domains though (for instance within the recovery domain A.4.2 in Figure 27).

If resource re-use is desired within I-NNI domains, then an additional ASSOCIATION object should be added as follow:

- Association Type: Resource Sharing ([RFC4873]);
- Association source and identifier: set as specified in section 6.7.2.
- For hard-rerouting, if resource re-use is desired, the Resource Sharing ASSOCIATION object must be added when the working connection is established (after a failure occurs, it may be impossible to add this object to the working connection to allow resource re-use with the recovery connection that will be established if the control plane is impacted by the failure too);
- For soft-rerouting, if resource re-use is desired, and if no Resource Sharing ASSOCIATION object was specified during the establishment of the connection being soft-rerouted, this object may be added to that connection at the time the soft-rerouting is triggered (and of course the same object must be added during the establishment of the new rerouting connection that follows).

In Figure 27, the source node [1] initiates the hard rerouting after it get the failure notification specifying E-NNI link [5-6], however the SNC<sup>7</sup> switches will be implemented E.g. in nodes [3] and [8] <sup>8</sup>instead of at the end-points: nodes [1] and [15] in a more classical approach.

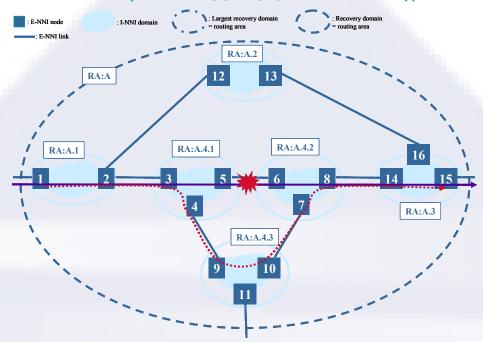

Figure 27: Example of re-use of resources over E-NNI links [2-3] & [8-14]

#### 6.7.4 Failure notification

## 6.7.4.1 Failure specification

A PathErr message is sent to report the detected failure to an upstream DIN or DEN. The Path\_State\_Removed Flag of the ERROR\_SPEC object must not be set.

A Notify message may be sent in addition. Its receipt must not abort the recovery process.

An IF\_ID ERROR\_SPEC object is used for the purpose of identifying the failure using two TLVs: an IF\_INDEX TLV and a REPORTING\_OSPF\_AREA TLV.

The REPORTING\_OSPF\_AREA identifies the recovery domain/routing area into which the failure identification (IF\_INDEX TLV fields) can be interpreted. Indeed, lower level recovery domains may be involved in the signaling involved in an upper level's recovery domain. Therefore, the lower level area has the potential to impact the information carried in the signaling messages. These areas must be able to identify if the Notify message being processed is within the scope of the lower level recovery domain and ignore Notify messages that are not within the scope of the lower level recovery domain and pass through the IF ID ERROR SPEC received from outside the area untouched.

www.oiforum.com

\_

<sup>&</sup>lt;sup>7</sup> Sub-Network Connection

<sup>&</sup>lt;sup>8</sup> Note that other nodes inside RA:A.4.1 and RA.A.4.2 can implement the SNC switches. This decision is left to the DIN of these domains (nodes 3 and 7) but is out of scope of this amendment.

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

When a Notify message is received by the ingress node to a domain, it will look to see if the REPORTING\_OSPF\_AREA TLV matches the routing area of the downstream interface the Notify message was received on.

In the Abstract Node case described in E-NNI Recovery amendment, an LINK\_EXCLUSIONS TLV containing a list of ingress links to the abstract node's border node which should be avoided may also be included in the IF\_ID ERROR\_SPEC.

Per [RFC4872]<sup>9</sup>, the error code and error value are set to "Notify Error (25) / LSP Locally Failed (11)" when a failure is detected. The error code and error value are set to "Notify Error (25) / LSP Recovered (10)" when a failure is cleared. The error node is originally set to the SC ID of the signaling controller having detected the failure. When a PathErr message being forwarded leaves a (N) recovery domain and enters an (N+1) upper recovery domain, the error node must be translated to the (N) DIN SC ID.

## The IF\_ID ERROR\_SPEC TLVs are processed as follows:

- When a transit node within a recovery domain, or the DEN of a recovery domain, detects a failure, it generates a PathErr message whose IF\_INDEX TLV specifies a transport node identifier and a link identifier. The REPORTING\_OSPF\_AREA TLV identifies that recovery domain. As long as this PathErr message is forwarded within the recovery domain where the failure occurred, these TLVs are not modified;
- When the DIN of a recovery domain detects a failure, it generates a PathErr message whose IF\_INDEX TLV specifies identifiers (abstract node or abstract link identifiers) that belong to the upper recovery domain; The REPORTING\_OSPF\_AREA TLV identifies that upper recovery domain.
- When the DIN of a recovery domain forwards a PathErr message outside of its recovery
  domain and into an upper recovery domain, it translates the IF\_INDEX TLV identifiers
  into identifiers (abstract node or abstract link identifiers) that belong to the upper
  recovery domain. The REPORTING\_OSPF\_AREA TLV is translated too to identify the
  upper recovery domain.

This error node and TLVs translations are performed by the DIN of a recovery domain being exited and where the failure could not be recovered. This translation does not occur when the PathErr message is forwarded within the same recovery domain the REPORTING\_OSPF\_AREA TLV is referring to.

For instance, in Figure 28 below, node 7 will send to node 10 a PathErr message specifying an IF\_ID TLV within the scope of RA A.4 (e.g., abstract node A.4.2). This TLV will not be modified by node 9 when it forwards the PathErr message to node 4. Only node 3 will modify the IF\_ID TLV when it forwards the PathErr message to node 2 (assuming here the connection cannot be restored within A.4), specifying information in the scope of RA A (e.g., abstract node A.4).

<sup>&</sup>lt;sup>9</sup> Note that [RFC4872] "Notify Error (25) / LSP Failure (9)" is not used in this amendment, since the switchover coordination is not handled by the control plane.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

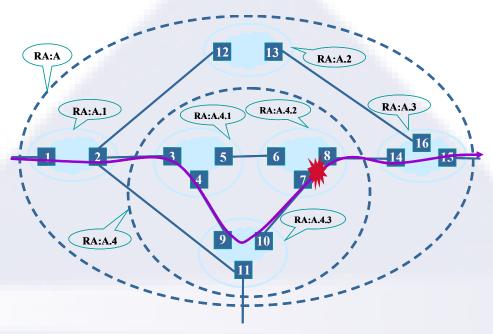

Figure 28: PathErr message forwarding

## 6.7.4.2 PathErr message forwarding

The PathErr message identifying a transport plane failure must be forwarded "hop-by-hop" across E-NNI interfaces, toward the source call controller.

Every time a domain is traversed, the identifiers of the connection received at the upstream/downstream E-NNI will have to be translated to the identifier used in the downstream/upstream E-NNI.

## 6.7.4.3 Notify message forwarding

Usage of a Notify message is optional. Its forwarding follows the same rules described in the previous sections. The same error codes and error values specified in section 6.7.4.1 are used.

A Notify message is sent to the CC whose SC ID was specified in the Path message.

Every time a domain is traversed, the identifiers of the connections listed in the <notify session list> (<upstream notify session>) object received at the upstream/downstream E-NNI will have to be respectively translated to the identifiers used in the downstream/upstream E-NNI.

Note also that when a CC receives a single Notify message listing multiple connections, because the upstream CCs for such connections may not be the same, the CC may forward upstream multiple Notify messages (each one toward different upstream CCs).

For instance, in Figure 29 below, Node 14 may send a single Notify message identifying both the red and purple connections, assuming both being impacted by the failure in A.3. When the Notify message reaches node 6, this node will have to send two Notify messages, one to node 5 and another to node 10.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

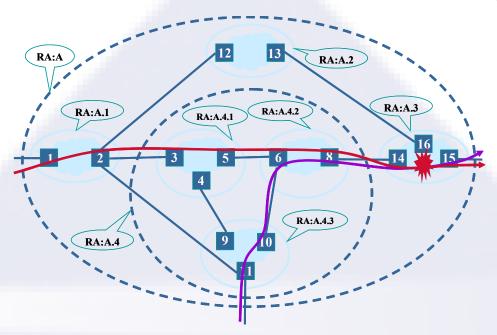

Figure 29: Example of forwarding a failure notification referencing multiple connections

## 6.7.5 Recovery mechanism-dependent signaling procedures

#### 6.7.5.1 1+1 Protection

As shown in Figure 30, the PROTECTION object is set as follows:

LSP (Protection Type) Flags: 0x08 (1+1 Unidirectional Protection) or 0x10 (1+1 Bidirectional Protection)

Secondary (S) / Protecting (P) / Notification (N) / Operational (O) bits:

- SPNO=0010b for the working connection setup;
- SPNO=0110b for the recovery connection setup;
- SPNO=0111b for the recovery connection activation.

The ASSOCIATION object is set as specified in section 6.3.11.3.2, the Association Type being set to 0x01 (Recovery).

E-NNI OTNv3 Amendment - RSVP-TE Signaling

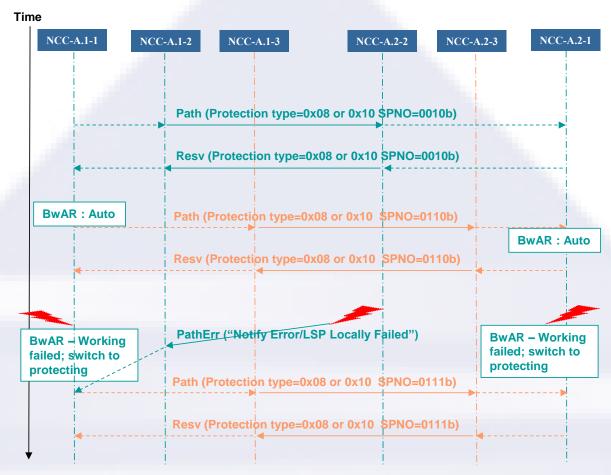

Figure 30: RSVP-TE Signaling for 1+1 Protection

Figure 30 is based on [OIF-ENNI-REC-AM-01.0] Figure 3 reference network. "BwAR", "B&R" and "XC" are terms defined in [OIF-ENNI-REC-AM-01.0].

Figure 30 assumes a bi-directional failure. In case of uni-directional failure, the automatic roll kicks in on one side only.

#### 6.7.5.2 Shared-mesh Restoration

As shown in Figure 31, the PROTECTION object is set as follows:

LSP (Protection Type) Flags: 0x02 Rerouting without Extra-Traffic

Secondary (S) / Protecting (P) / Notification (N) / Operational (O) bits:

- SPNO=0000b for the working connection setup;
- SPNO=1100b for the recovery connection setup;
- SPNO=0100b for the recovery connection activation.
- SPNO=1100b for the recovery connection de-activation (which implicitly activates the working connection see the abstract message sequence diagram in the E-NNI Recovery amendment).

E-NNI OTNv3 Amendment – RSVP-TE Signaling

The ASSOCIATION object is set as specified in section 6.3.11.3.2, the Association Type being set to 0x01 (Recovery).

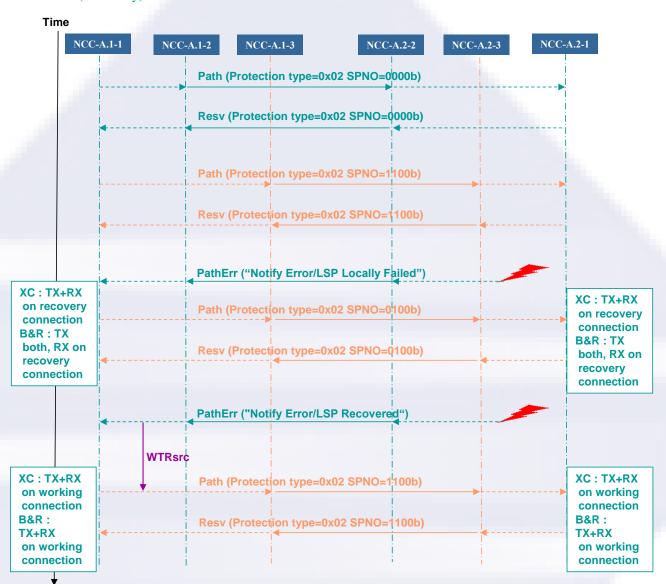

Figure 31: RSVP-TE Signaling for shared-mesh restoration recovery

Figure 31 is based on [OIF-ENNI-REC-AM-01.0] Figure 3 reference network. "BwAR", "B&R" and "XC" are terms defined in [OIF-ENNI-REC-AM-01.0].

#### 6.7.5.3 Revertive full-rerouting

As shown in Figure 32, the PROTECTION object is set as follows:

LSP (Protection Type) Flags: 0x01 (Full) Rerouting

Secondary (S) / Protecting (P) / Notification (N) / Operational (O) bits:

• SPNO=0000b for the working connection setup;

E-NNI OTNv3 Amendment - RSVP-TE Signaling

- SPNO=0000b for the combined recovery connection setup and activation;
- SPNO=1000b for the recovery connection de-activation (which implicitly activates the working connection see the abstract message sequence diagram in the E-NNI Recovery amendment).

The ASSOCIATION object is set as specified in section 6.3.11.3.2, the Association Type being set to 0x01 (Recovery). A second ASSOCIATION object can be used with the Association Type set to Resource Sharing if resource reuse is desired as specified in section 6.7.3.

It is a local policy at the DEN to determine when the B&R mechanism is established<sup>10</sup>.

www.oiforum.com

\_

<sup>&</sup>lt;sup>10</sup> The DEN controller does not know at the time the recovery connection is setup, whether the full-rerouting operation is revertive or non-revertive (see also section 7.7.5.4). Therefore, if B&R is supported, the DEN controller may not setup the B&R mechanism at that time, but may wait for the recovery connection de-activation (meaning a revertive full-rerouting operation) before setting up a B&R mechanism in the dataplane.

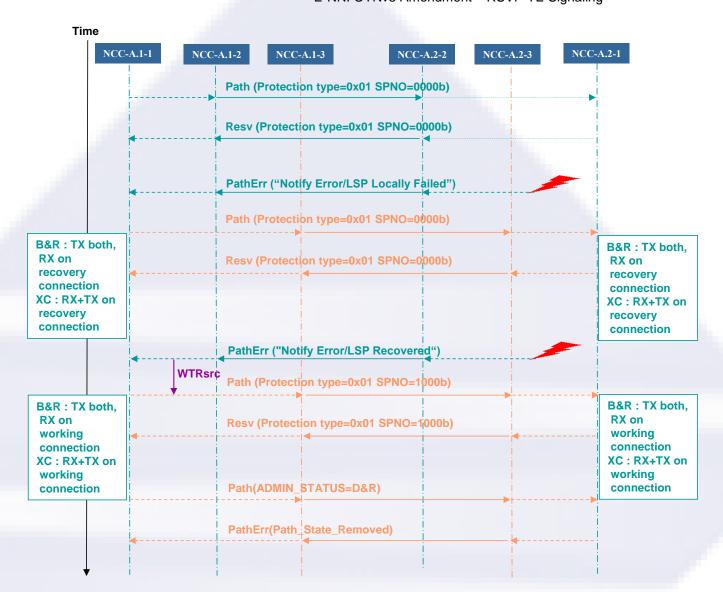

Figure 32: RSVP-TE Signaling for revertive full-rerouting recovery

Figure 32 is based on [OIF-ENNI-REC-AM-01.0] Figure 3 reference network. "BwAR", "B&R" and "XC" are terms defined in [OIF-ENNI-REC-AM-01.0].

## 6.7.5.4 Non-revertive full-rerouting

In Path messages, the E-NNI Recovery sub-object of an OIF\_RECOVERY\_STACK object carries a PROTECTION object and an ASSOCIATION object. In Resv messages, it carries a PROTECTION object, no ASSOCIATION object.

As shown in Figure 33, the PROTECTION object is set as follows:

LSP (Protection Type) Flags: 0x01 (Full) Rerouting

Secondary (S) / Protecting (P) / Notification (N) / Operational (O) bits:

• SPNO=0000b for the working connection setup;

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

• SPNO=0000b for the combined recovery connection setup and activation; Note that the SPNO setting for the working and recovery connections setup is no different than the revertive full-rerouting case.

The ASSOCIATION object is set as specified in section 6.3.11.3.2, the Association Type being set to 0x01 (Recovery). A second ASSOCIATION object can be used with the Association Type set to Resource Sharing if resource reuse is desired as specified in section 6.7.3.

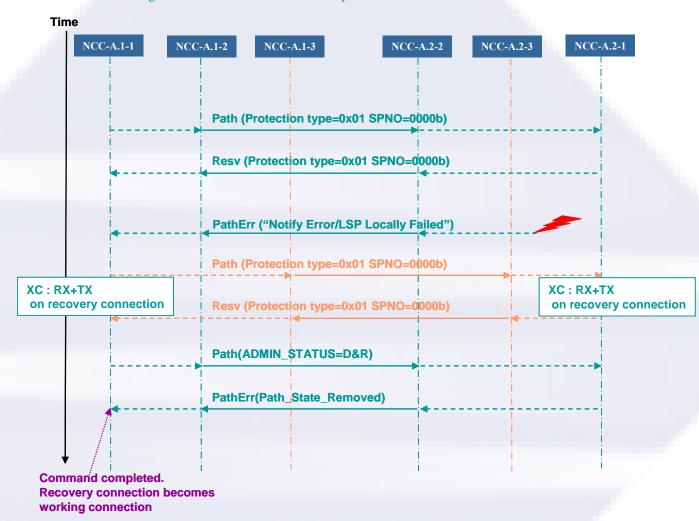

Figure 33: RSVP-TE Signaling for non-revertive full-rerouting recovery

Figure 33 is based on [OIF-ENNI-REC-AM-01.0] Figure 3 reference network. "BwAR", "B&R" and "XC" are terms defined in [OIF-ENNI-REC-AM-01.0].

#### 6.7.6 Reversion

## 6.7.6.1 Retention of the failed nominal path

When reversion is required, the source node CC must maintain the original connection. This is done by:

#### E-NNI OTNv3 Amendment - RSVP-TE Signaling

- Maintaining the original session (keep sending refresh messages);
- Allowing graceful restart [RFC3473] to re-synchronize the state of the session (if the adjacent CC failed together with the transport plane).

## 6.7.7 Combination of protection and hard rerouting and soft rerouting

In a recovery domain where a 1+1 protection mechanism has been selected for a call, the working or protecting connection may be hard or soft-rerouted (note: both the working and protecting connections may be soft-rerouted at a given point in time). In such a case, two working connections or two protecting connections will belong to the same recovery association (so there may be up to four connections being signaled in a recovery domain with the same recovery association, at a given point in time)<sup>11</sup>:

- A new working connection (respectively protecting connection) takes precedence over an existing working connection (respectively protecting connection): in case of B&R, the bridge leg must be moved from the existing working connection (respectively protecting connection) to the new working connection (respectively protecting connection).
- Setting the S bit for a working connection (respectively protecting connection) means that this working connection (respectively protecting connection) is de-activated: in case of B&R, the bridge leg must be moved to the other working connection (respectively protecting connection) if it exists.

Moreover, in case of soft-rerouting, the original working or protecting connection MUST be put administratively down by setting the A bit in the ADMIN\_STATUS object. In case of temporary soft-rerouting ([OIF-ENNI-REC-AM-01.0]), the ADMIN\_STATUS object A bit MUST be reset before or after initiating the reversion process (i.e. de-activating the maintenance connection).

In case of hard-rerouting, the original working or protecting connection SHOULD be put administratively down by setting the A bit in the ADMIN\_STATUS object (note that this may not be possible if the failure impacted the control plane too). In case of revertive hard-rerouting, the ADMIN\_STATUS object A bit MUST be reset before or after initiating the reversion process (i.e. de-activating the hard-rerouting connection).

Section 11 provides signaling examples for the combination of 1+1 protection and hard/soft-rerouting.

<sup>&</sup>lt;sup>11</sup> Resource sharing association may also be used but this item is for further study.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

## 7 Compatibility with UNI and E-NNI

Any unknown protocol objects shall be handled according to the methods of their specific protocols.

- 1) In RSVP-TE, (per [RFC2205]) the class number range has three categories for unknown class
  - a. 0-127: the message should be rejected with "Unknown Object Class" error
  - b. 128-191: the message should not be rejected but the unknown class should be dropped
  - c. 192-255: the message should not be rejected and the unknown class should be forwarded without examination and modification

### 7.1 Multilayer Amendment Compatibility with UNI

Most of the multilayer amendment extensions [OIF-ENNI-ML-AM-01.0] are transparent to UNI 1.0 and UNI 2.0 implementations. The UNI-Cs SHOULD remain unaware of the multilayer aspects of the network, if applicable but the UNI-C implementations MUST support the new type of source LSR address for the Call ID as described in section 6.3.14. As UNI 1.0 and UNI 2.0 were not explicitly supporting this Call ID format, implementations that do not support this format need to be upgraded to support this Call ID format in order to interwork with a multilayer network.

## 7.2 Multilayer Amendment Compatibility with E-NNI

The multilayer amendment [OIF-ENNI-ML-AM-01.0] is an extension to E-NNI 2.0. In order to provide multilayer signaling, all nodes at the layer boundaries, i.e. providing adaptation, MUST support this amendment in order to provide multilayer signaling.

Intermediate E-NNI nodes MAY provide only E-NNI 1.0 or E-NNI 2.0 functionality but MUST support the new type of source LSR address for the Call ID as described in section 6.3.14. As E-NNI 1.0 and E-NNI 2.0 were not explicitly supporting this Call ID format, implementations that do not support this format need to be upgraded to support this Call ID format in order to interwork with a multilayer network.

This amendment introduces changes in the Ethernet signaling based on [OIF-UNI-02.0-R2-RSVP] that are not backward compatible with E-NNI 2.0. Implementations of this Implementation Agreement that support Ethernet services MUST support the ability to configure the neighbor's version in order to determine which codepoints and encodings to use for Ethernet based signaling. The version is only used to determine which Ethernet signaling codepoints to use and does not impact other aspects of this amendment.

## 7.3 Recovery Amendment Compatibility with E-NNI

## 7.3.1 Compatibility with OIF E-NNI Signaling 1.0

[OIF-E-NNI-sig-01.0] does not support recovery. Indeed, E-NNI 1.0 does not support:

#### E-NNI OTNv3 Amendment – RSVP-TE Signaling

- the NOTIFY\_REQUEST object,
- the use of the A-bit in the ADMIN\_STATUS object to declare a connection "Administratively DOWN",
- the OIF\_RECOVERY\_STACK object.

Consequently, there is no backward compatibility between this amendment and [OIF-E-NNI-sig-01.0].

## 7.3.2 Compatibility with OIF E-NNI Signaling 2.0

An implementation may be compliant to [OIF-E-NNI-sig-02.0], but may not support this recovery amendment.

- To enable recovery for a connection in a domain, the DIN and DEN with regard to that connection must support this amendment;
- To enable resource reuse across a given E-NNI link, both the eNNI-U and eNNI-D nodes must support this amendment;

However, this amendment also requires to be supported by all nodes inside a recovery domain. Indeed, there is an issue with [OIF-E-NNI-sig-02.0]:

• All nodes belonging to a recovery domain need to be able to perform failure notification (see 7.1.6).

This amendment obsoletes the use of the PROTECTION object as described in [OIF-E-NNI-sig-02.0] as it did not include any semantics. The usage of the PROTECTION object is now fully specified as a sub-object of the OIF\_RECOVERY\_STACK and implementations of this amendment MAY reject requests that include a PROTECTION object not embedded within the OIF\_RECOVERY\_STACK.

The OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1 vendor private object has been chosen to carry the OIF\_RECOVERY\_STACK object (section 7.1.1) so that nodes that do not recognize this object will reject a Path message specifying such an object. As a consequence, [OIF-E-NNI-sig-02.0] compliant nodes that do not support this amendment cannot take part in recovery signaling.

The crankback mechanism described below allows some interworking between this amendment and [OIF-E-NNI-sig-02.0].

### 7.3.3 Crankback

A crankback mechanism may be used to dynamically identify, and go around, nodes that do not support this recovery amendment, when trying to establish working or recovery connections.

[OIF-E-NNI-sig-01.0] or [OIF-E-NNI-sig-02.0] compliant nodes will reject a Path message specifying a OIF\_RECOVERY\_STACK object with a PathErr message. The PathErr error code should be set to "Unknown object class", and the error value should be set to 0x7f01 (Class number and C-Type of the unknown OIF\_RECOVERY\_STACK object).

When receiving such a PathErr message, the DIN of the recovery domain may try to compute a new route across its domain, excluding the node that generated the PathErr message.

E-NNI OTNv3 Amendment – RSVP-TE Signaling

## 7.4 OTNv3 Compatibility with E-NNI

To establish OTNv3 connections across the E-NNI, both the upstream and downstream E-NNI nodes must support E-NNI Signaling 2.0 and the OTNv3 RSVP-TE extensions described in this update.

E-NNI Signaling 2.0 [OIF-E-NNI-02.0] supports the ability to establish OTNv1 ODU types (i.e., ODU1, ODU2 and ODU3) using procedures based on [RFC4328]. If the E-NNI neighbor supports E-NNI Signaling 2.0 but not the OTNv3 extensions, then the local node MAY revert to E-NNI Signaling 2.0 without OTNv3 extensions. In this case, the format for the GENERALIZED\_LABEL\_REQUEST, GENERALIZED\_LABEL, and OTN (OTNv1) SENDER\_TSPEC/FLOWSPEC objects as described in E-NNI Signaling 2.0 SHALL be used. Only OTNv1 ODU rates are supported.

Implementations that support both OIF E-NNI Signaling 2.0 OTNv1 signaling in addition to the OTNv3 extensions in this amendment are not required to support a translation function between OTNv1 and OTNv3 signaling.

E-NNI 2.0 nodes that do not support this amendment will not be able to process the OTNv3 signaling extensions. If an OTNv3 connection is to be signaled over an E-NNI link that does not support the OTNv3 extensions, then the establishment of the OTNv3 connection must fail and an error message sent back to the call source node. The error message SHOULD state "Routing Problem/Switching Type".

The call source node may choose to signal using OTNv1 or OTNv3 signaling procedures depending on routing information, local policy or in response to error messages received on previous setup attempts.

E-NNI Signaling 1.0 does not support OTN. Therefore, if the E-NNI neighbor supports E-NNI Signaling 1.0, then OTN services SHALL NOT be attempted over the E-NNI.

The neighbor E-NNI protocol release and features can be automatically learned or manually configured. The automatic learning of neighbor capabilities is outside the scope of this Implementation Agreement.

#### 7.5 OTNv3 Compatibility with the Multilayer Extensions (E-NNI 2.1)

The OTNv3 updates build upon the multilayer extensions, especially in the signaling of ODU hierarchy. The OTNv3 extensions are fully compatible with the Multilayer extensions. Where needed, the Multilayer objects have been updated to support OTNv3-specific attributes such as layer and adaptation definitions.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

## 10 Appendix II: Summary of Multilayer Extensions

The following extensions were made as part of the Multilayer Amendment:

- Added OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1 and OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_3 to the Path message in section 6.2.2, to the Resv message in section 6.2.3 and defined new sub-objects in Table 5, Table 6, sections 6.3.11 and 6.3.12
- Added support for the INTSERV\_TPSEC and INTSERV\_FLOWSPEC in sections 6.2.2, 6.2.3, 6.3.10, Table 5 and Table 6.
- Added support for inverse multiplexing and transitional link support in the ERO and RRO in sections 6.3.2, 6.3.3 and Table 6.
- Clarified usage of SPC\_LABEL for multilayer in section 6.3.4.
- Added support for the IPv4 RSVP\_HOP in section 6.3.6.
- Added support for VCAT labels in section 6.3.13.
- Defined a new Source LSR address type for the Call ID in section 6.3.14.
- Defined Layer Identifier in section 6.3.15 and Adaptation in section 6.3.16.
- Added new Call Modification details for VCAT in sections 6.4.2 and subsections 6.4.2.2 and 6.4.2.4.
- Addressed Multilayer compatibility with UNI and E-NNI in sections 7.1 and 7.2.
- Updated references to OIF documents and added a reference to IETF RFC6003 in section 8.
- Added an example nested ERO/RRO encoding in section 9.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

# 11 <u>Appendix III:: Combined 1+1 protection and soft/hard</u> rerouting

This appendix provides signaling examples for combined 1+1 protection and soft/hard rerouting. This appendix does not provide an exhaustive list of all possible ways for the DIN of a recovery domain to combine 1+1 protection and soft/hard rerouting.

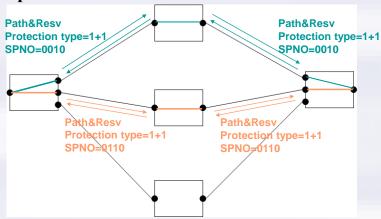

## 11.1 Combined 1+1 protection and soft rerouting

Figure 34 shows a signaling example to perform a soft-rerouting of a working connection.

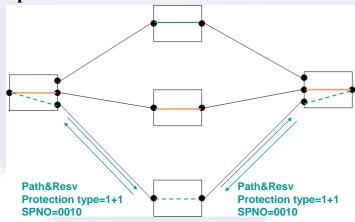

- Step 1: the 1+1 protection working and protecting connections are established as usual;
- Step 2: a third connection is established for maintenance purpose. It can be a working or a protecting connection depending on which one is being soft-rerouted (the working one has been chosen on Figure 34).
- Step 3: the ADMIN\_STATUS A bit is set for the original (soft-rerouted) working or protecting connection.

Note: Step 3 may be performed before Step 2. Or Step 3 and Step 2 may be performed concurrently. Receiving implementation should handle any ordering.

## Step 1

## Step 2

E-NNI OTNv3 Amendment - RSVP-TE Signaling

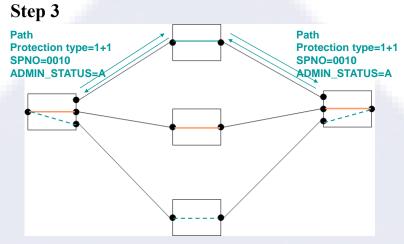

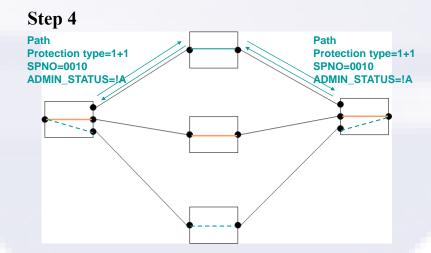

Figure 34: Combined 1+1 protection and soft-rerouting

At this stage, if this is a permanent soft-reroute operation, the original working or protecting connection is torn down. Otherwise, the connection is maintained for reversion at a later stage.

For reversion (Figure 35):

- Step 4: the ADMIN\_STATUS A bit is unset for the original (soft-rerouted) working or protecting connection.
- Step 5:the maintenance connection is de-activated.
- Then the maintenance connection can be torn down.

Note: Step 5 may be performed before Step 4.

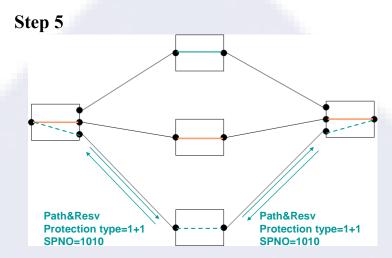

Figure 35: Reversion for combined 1+1 protection and soft-rerouting

#### 11.2 Combined 1+1 protection and hard rerouting: "always on"

Figure 36 shows an example of a signaling sequence after the failure of the working connection:

- Step 1: The 1+1 protection working and recovery connections are established; note that the LSP (Protection Type) Flags field (PROTECTION object) is set either to 0x09 or 0x11.
- Step 2: When a failure occurs for one of the working or protecting connection, it is notified to the recovery domain DIN. Note that if the failure occurs for the working connection, the recovery one will be activated as described in section 6.7.5.1, but this is not shown on Figure 36 (this figure chooses to show a working connection failure).
- Step 3: Hard-rerouting may be triggered (depending on the DIN local policies).

# Path&Resv Protection type=1+1&full-rerouting SPNO=0010 Path&Resv Protection type=1+1&full-rerouting SPNO=0010 Path&Resv Protection type=1+1&full-rerouting SPNO=0110 Path&Resv Protection type=1+1&full-rerouting SPNO=0110

E-NNI OTNv3 Amendment – RSVP-TE Signaling

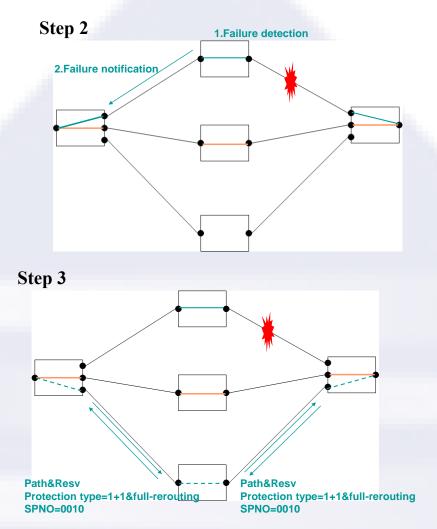

Figure 36: Combined protection and hard-rerouting ("always on protection")

For reversion, the hard-rerouting connection may be first de-activated (similar to Figure 35). Then the hard-rerouting connection can be torn down.

# 11.3 Combined 1+1 protection and hard rerouting: "2<sup>nd</sup> level restoration"

Figure 37 shows an example of a signaling sequence where the DIN chooses to hard-reroute the protecting connection after both the working and protecting connections have failed:

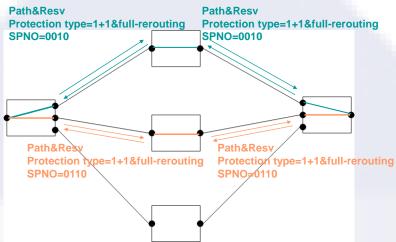

- Step 1: The 1+1 protection working and recovery connections are established; note that the LSP (Protection Type) Flags field (PROTECTION object) is set either to 0x09 or 0x11;
- Step 2: When a first failure occurs (impacting either the working or protecting connection), no hard-rerouting is triggered. Note that if the failure occurs for the working connection, the recovery one will be activated as described in section 6.7.5.1, but this is not shown on Figure 37. Only when a second failure occurs (impacting the other working or protecting connection), hard-rerouting is triggered (Step 3). It is a local decision at the

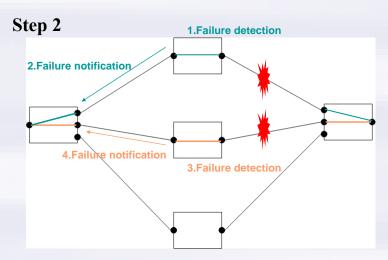

E-NNI OTNv3 Amendment – RSVP-TE Signaling

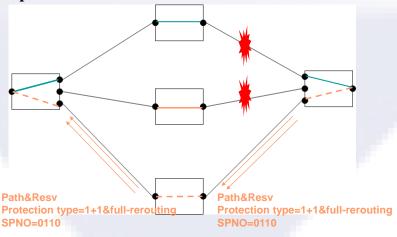

DIN to restore either the working or protecting connection. Figure 37 chooses to show the restoration of the protecting connection

# Step 1

# Step 3

E-NNI OTNv3 Amendment – RSVP-TE Signaling

# Figure 37: Combined protection and hard-rerouting ("2nd level restoration")

For reversion, the hard-rerouting connection may be first de-activated (Figure 38). Then the hard-rerouting connection can be torn down.

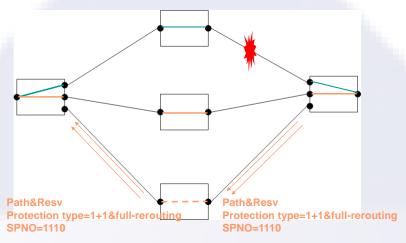

Figure 38: Combined protection and hard-rerouting ("2nd level restoration"). Reversion.

E-NNI OTNv3 Amendment - RSVP-TE Signaling

# 12 Appendix IV:: Examples OIF\_RECOVERY\_STACK object

This appendix provides OIF\_RECOVERY\_STACK object encoding examples. They are based on **Figure 39**.

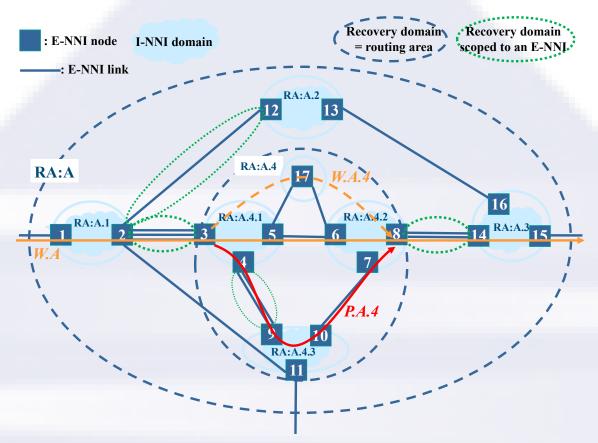

Figure 39: OIF\_RECOVERY\_STACK examples

#### 12.1 Within a nested recovery domain

The following OIF\_RECOVERY\_STACK object encoding assumes:

- There was no OIF\_RECOVERY\_STACK object specified by the Path message received by node 1 for connection *W.A*;
- That node 1 (DIN for recovery domain RA:A), based on its local policies and the G.UNI service level, selected:
  - "Revertive hard-rerouting" for the recovery mechanism within recovery domain RA:A; Resource re-use across E-NNI links and within I-NNI domains is required;
  - o 7 as recovery domain RA:A "local domain service level";

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

- That node 3 (DIN for recovery domain RA:A.4), based on its local policies and the "local domain service level" specified by the top E-NNI Recovery sub-object (i.e. 7) in the received OIF\_RECOVERY\_STACK object, selected:
  - o "1+1 Protection" for the recovery mechanism within recovery domain RA:A.4;
  - o 1 as recovery domain RA:A.4 "local domain service level";

Then the encoding of the OIF\_RECOVERY\_STACK specified in the Path message sent across recovery domain RA:A.4 for the protecting connection *P.A.4* is as follows:

# 12.2 Protection and soft-rerouting combination

The operator of recovery domain RA:A.4 later chooses to trigger a soft-rerouting of the working leg (through the abstract node 17, the soft-rerouting connection being shown as W.A.4 in **Figure 39**).

Resource re-use across E-NNI links and within I-NNI domains is required.

The encoding of the OIF\_RECOVERY\_STACK specified in the Path message sent across recovery domain RA:A.4 for the soft-rerouting/working connection *W.A.4* is as follows:

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

E-NNI OTNv3 Amendment – RSVP-TE Signaling

# 12.3 Recovery across an E-NNI scoped recovery domain

The recovery connection within recovery domain RA:A.4 may itself be protected when it crosses the E-NNI scoped recovery domain between Node 4 and Node 9. Assuming no 1+1 APS link, two working and protecting connections will be signaled between Node 4 (DIN) and Node 9 (DEN).

The encoding of the OIF\_RECOVERY\_STACK specified in the Path message for the protecting connection is as follows:

# E-NNI OTNv3 Amendment – RSVP-TE Signaling

# 13 Appendix V: Summary of Recovery Extensions

The following extensions were made as part of the Recovery Amendment:

- Defined a new OIF\_VENDOR\_PRIVATE\_EXTENSION\_TYPE\_1 sub-object in Table 5, Table 6, and section 6.3.11.3
- Added support for REPORTING\_OSPF\_AREA and LINK\_EXCLUSIONS TLVs (ERROR\_SPEC sub-objects) in section 6.3.1;
- Addressed Recovery compatibility with E-NNI in section 7.3.
- Updated references to OIF documents and added references to IETF RFC4872, RFC4873, RFC6689 and RFC6780 in section 8.
- Added examples for Combined 1+1 protection and soft/hard rerouting in section 11.
