Implementation Agreement for Coherent CMIS

IA OIF-C-CMIS-01.4

April 24, 2025

Implementation Agreement created and approved OIF www.oiforum.com

The OIF is an international non-profit organization with over 150 member companies, including the world's leading carriers and vendors. Being an industry group uniting representatives of the data and optical worlds, OIF's purpose is to accelerate the deployment of interoperable, cost-effective and robust optical internetworks and their associated technologies. Optical internetworks are data networks composed of routers and data switches interconnected by optical networking elements.

With the goal of promoting worldwide compatibility of optical internetworking products, the OIF actively supports and extends the work of national and international standards bodies. Working relationships or formal liaisons have been established with EA, IEEE 802.3, INCITS T11, Infiniband, IPEC, ITU SG-15, PCI-SIG, SNIA SFF.

ABSTRACT: Implementation Agreement created by the Optical Internetworking Forum for the MIS of Coherent Modules. The first module to use this MIS is based on the 400ZR spec and the first release of this document will be focused on 400ZR. The project start was approved at the Q2 Technical Meeting, April 2013 (Albuquerque, USA).

Notice: This Technical Document has been created by the Optical Internetworking Forum (OIF). This document is offered to the OIF Membership solely as a basis for agreement and is not a binding proposal on the companies listed as resources above. The OIF reserves the rights to at any time to add, amend, or withdraw statements contained herein. Nothing in this document is in any way binding on the OIF or any of its members.

The user's attention is called to the possibility that implementation of the OIF implementation agreement contained herein may require the use of inventions covered by the patent rights held by third parties. By publication of this OIF implementation agreement, the OIF makes no representation or warranty whatsoever, whether expressed or implied, that implementation of the specification will not infringe any third party rights, nor does the OIF make any representation or warranty whatsoever, whether expressed or implied, with respect to any claim that has been or may be asserted by any third party, the validity of any patent rights related to any such claim, or the extent to which a license to use any such rights may or may not be available or the terms hereof.

Copyright © 2025 Optical Internetworking Forum

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published and distributed, in whole or in part, without restriction other than the following, (1) the above copyright notice and this paragraph must be included on all such copies and derivative works, and (2) this document itself may not be modified in any way, such as by removing the copyright notice or references to the OIF, except as needed for the purpose of developing OIF Implementation Agreements.

By downloading, copying, or using this document in any manner, the user consents to the terms and conditions of this notice. Unless the terms and conditions of this notice are breached by the user, the limited permissions granted above are perpetual and will not be revoked by the OIF or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and THE OIF DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY, TITLE OR FITNESS FOR A PARTICULAR PURPOSE.

DATE:

April 24, 2025

Table 1: IA Document Revision History

Document	Date	Revisions/Comments
OIF-C-CMIS-01.0	Jan 14 th 2020	Initial document release
OIF-C-CMIS-01.1	June 10 th 2020	Minor update to update link to 400ZR IA and IC- TROSA
OIF-C-CMIS-01.2	March 21 st 2022	This version was voted on as V2.0 but the nature of the changes did not warrant a major up version. Updates from maintenance comments, additions of new VDMs, additions of new flags, addition of page 43h for provisioning advertising, addition of page 44h for flag advertising
OIF-C-CMIS-01.3	October 12 th 2023	Maintenance update to address issues reported since last update.
OIF-C-CMIS-01.4	April 24, 2025	Maintenance update to address issues reported since last update and add new functionality requested through contributions.

Rev 1.2

Revision 1.2 made the following updates.

- General add custom registers to all pages at the end of the page
- Section 5.2 remove the memory map diagram and replace it with a table that provides page details and describes banking for each page.
- Section 5.3 add text to clarify that alarm direction is normalized to the module.
- Section 7.1 clarify that the freeze mechanism is described in the VDM section of CMIS
- Section 7.3.1
 - Updated type 137 from SOPMD to SOPMD high granularity

- Added type 148 Clock recovery loop
- Added type 149 SOPMD low granularity
- \circ $\;$ Removed note about multiple TECs, not applicable to C-CMIS $\;$
- \circ $\;$ Added note1 to describe clock recovery loop
- o Added note2 to describe chromatic dispersion
- Section 7.4.2 clarified the relationship between power threshold in page 02h (CMIS) vs page 30h (C-CMIS)
- Section 7.4 added RxLOF and RxLOM masks flags to 32h:130 and 33:130
- Section 7.4.7 adding text to clarify that it is CMIS fine interval
- Section 7.4.8
 - Updated SOPMD to HGSOPMD
 - Added Clock recovery loop registers
 - Added LGSOPMD registers
- Section 7.5 updated flag direction of all host alarms. Rx = media to host and Tx = host to media
- Section 7.5.1 correct page for host FED alarm bit
- Section 7.5.3 added FlexE and PCS layer flags and masks
- Section 7.6.2
 - o Updated SOPMD to HGSOPMD
 - Added Clock recovery loop registers
 - Added LGSOPMD registers
- Section 7.6.3 added lfInsertionOnLdEnableImpl
- Section 7.6.4 added page 44h for alarm implemented
- Section 9 updated Glossary

Rev 1.3

Revision 1.3 made the following updates.

- Add note in implementation notes section about HG and LG advertising mistake.
- Add MER implemented advertising in 42h:139
- Add missing Flexe RPF flag and mask in page 3Bh and advertisement in 44h:134
- Add C-CMIS revision number in 40h:128
- Add SNR margin, Q factor and Q margin PMs to VDM types, page 35h and page 42h
- Clarify bank to leading host lane relationship in section 5.3
- Add RS-FEC corrected frames counter to page 3Ah
- Changed name of VDM EVM_modem to EVM and updated the note
- Added Q-value to Glossary
- Updated links to reference documents.
- Clarified FDD/FED flag timing.
- Added RxLOSType in page 41h

Rev 1.4

Revision 1.4 made the following updates.

• Added consequent action enable for Payload Type mismatch and media FED

- Added enable for LF insertion on CSF.
- Added maintenance signal insertion control register.
- Added consequent action hold off timer registers for rx and tx.
- Added CD target set provisioning register.
- Added multiple alarms and corresponding masks.
- Added status for rx Payload type, expected Rx Payload type and tx Payload type.
- Added Replacement signal insertion control registers.
- Added advertising registers for new alarms, status and provisioning additions.
- Added new CDB command: Get Coherent Application Attributes.

5 Introduction

5.1 Scope

This Implementation Agreement extends the Common Management Interface Specification [CMIS] to allow management of digital coherent optics (DCO) modules. This Implementation Agreement will be referred to as Coherent CMIS or C-CMIS and is used in conjunction with [CMIS].

Coherent CMIS defines additional management registers, messages (CDB), and monitors (VDM), together with new functionality, mechanisms, or behaviors, as needed. The relevant address spaces or name spaces have been reserved "for coherent" in [CMIS].

The initial release of C-CMIS covers 400ZR modules [400ZR IA] only, which support a single data path with eight-lane host interface for a 400GBASE-R PCS signal and a single-lane 400G coherent media interface (with a new signal format called 400ZR). However, the C-CMIS scope is expected to be extended to other types of DCO modules in the future.

NOTE – C-CMIS deliberately defines some host side registers which are expected to be used in DCO modules only (Section 0

).

5.2 Memory Page Structure

The following table lists the pages described in this document. The baseline specification pages used to manage a module are defined in [CMIS].

Page Number	Page Description	Notes
30h	Media Lane Configurable Thresholds	Media Lane Banking
31h	Media Lane Provisioning	Media Lane Banking
32h	32h Media Lane Flag Masks Media La	
33h	33h Media Lane Flags and Status	
34h	Media Lane FEC Performance Monitoring	Media Lane Banking
35h Media Lane Link Performance Monitoring		Media Lane Banking
36-37h	36-37h Reserved	
38h	Data Path Host Interface Configuration	Host Lane Banking

Table 2: Memory Page Structure

39h	Reserved Data Path Interface Future Use	
3Ah	Data Path Host Interface Performance Monitoring	Host Lane Banking
3Bh	Data Path Host Interface Flags and Masks	Host Lane Banking
3C-3Fh	Reserved	
40h	Reserved for Applications Advertisement	
41h	Rx Signal Power Advertisement and Ranges for Configurable Thresholds	
42h	Performance Monitoring Advertisement	
43h Media Lane Provisioning Advertisement		
44h	44h Alarm Advertisement	
45h – 4Fh	Reserved	

Note 1: Media Lane Banking means 1 bank per media lane.

Note 2: Host Lane Banking means banked per data path, Bank Index is the host lane id of the lowest host lane in the data path.

Note 3: C-CMIS defines VDM types that are used in pages 20h-2Fh. The register definitions for these pages and description of VDM usage is captured in CMIS.

5.3 Terminology Mapping (C-CMIS versus CMIS and 400ZR)

CMIS describes the function of a module with the concept of data paths carrying applications. In this model, a 400ZR module implements a single data path with eight host lanes and one media lane. This 400ZR data path can carry one of two possible applications. These 400ZR applications are referred to a "DWDM, noise limited" and "Single-Channel, loss limited", respectively.

The CMIS register model is based on individual electrical host lanes and media lanes, with data path related attributes replicated on all lanes. However, in the context of Coherent CMIS, it is more appropriate to move away from the physical lane view and instead refer to the transported useful 400GBASE-R multi-lane signal as a whole. At the same time the replication of data path related attributes across the physical lanes of the data path are avoided in the C-CMIS registers.

The 400ZR line side interface is considered to use a single media lane (wavelength), so Coherent CMIS will continue to refer to the network side related registers as media lane registers.

The 400ZR host side interface of a 400ZR application is 400GAUI-8 or 4x100GAUI-2, an eightlane electrical interface which is an example of a multi-lane interface. All registers pertaining to processing the entire client signal carried over this multi lane interfaces are referred to as host interface registers (there is no duplication of these registers for individual lanes). The relationship between host lane and bank is shown below.

Bank 0 = Leading Host Lane 1

Bank 1 = Leading Host Lane 2

Bank 2 = Leading Host Lane 3

Bank 3 = Leading Host Lane 4

Bank 4 = Leading Host Lane 5

Bank 5 = Leading Host Lane 6

Bank 6 = Leading Host Lane 7

Bank 7 = Leading Host Lane 8

For a 4x100GE 400ZR module, the leading host lanes are 1,3,5,7 and the corresponding banks are 0,2,4,6

To prepare for future modules possibly providing more than one data path, strictly we need to distinguish a module's host interface and media interface from the host interface and media interface of an individual data path.

To simplify the language and because of its data path centric view, C-CMIS uses the term host interface and media interface always in relation to a data path. If (rarely) the module view is needed, we use the prefixed terms module host interface and module media interface. The direction of alarms and PMs is normalized to the module view. All Tx alarms/PMs are in the host to media direction and all Rx alarms/PMs are in media to host direction.

5.4 Register Nomenclature:

5.4.1 Register Names

The register naming convention is camelback. The names are unique within the table.

5.4.2 Register Data Notation

When referring to register data types, the following data notation is used:

Data Notation	Data Type
U8	Unsigned 8 bit register
U16	Unsigned 16 bit register
S16	Signed 16 bit register

Table 3: Register Data Notation

U32	Unsigned 32 bit register
S32	Signed 32 bit register
U64	Unsigned 64 bit register
S64	Signed 64 bit register
F16	16 bit floating point register
F32	32 bit floating point register

5.4.3 Register Address Notation

When referring to certain registers, bits, or fields using the following address notation is used:

<reference></reference>	:=	[<bank-range>: [<pa< th=""><th>ge-range>:]] <byte-range> [.<bit-or-field>]</bit-or-field></byte-range></th></pa<></bank-range>	ge-range>:]] <byte-range> [.<bit-or-field>]</bit-or-field></byte-range>
<bank-range></bank-range>	:=	[<bank>-]<bank></bank></bank>	
<page-range></page-range>	:=	[<page>-]<page></page></page>	
<bit-or-field></bit-or-field>	:=	<bit>[-<bit>]</bit></bit>	
<bit></bit>	:=	"single digit decimal"	(0 7)
<byte></byte>	:=	"decimal"	(0 255)
<page></page>	:=	"hexadecimal"	(00h FFh)
<bank></bank>	:=	"decimal"	(0 255)

Table 4 - Register notation Example

Example notation	Description of displayed register	Description of Register	
2h:3Ah:128-135	Bank 2h, page 3Ah bytes 128-135	txBitsPm for lane 3	
85	Lower memory 0, Byte 85	Module Type advertising code	
04h:128.2-1	Page 04h, Byte 128, Bits 2 and 1	12.5 and 6.25 GHz grid supported	

6 Implementation Notes

6.1 400ZR implementation notes

This section specifies how certain CMIS features shall be used by 400ZR modules.

6.1.1 400ZR CMIS Module Application Advertisement

CMIS requires pluggable modules to identify supported application in the Application Advertising tables 00h:85-117 and 01h:176.

A 400ZR module advertises its default application code in 00h:85-89 and 01h:176 as illustrated in Table 5.

A dual mode 400ZR module will have to advertise both applications.

Byte	Bits	ApSel	Name	Value	Description	
		Code				
85	7-0	N/A	Module Type Encoding	02h	Optical Interface: SMF	
86	7-0	0001b	Host Electrical Interface Code	11h	400GAUI-8 C2M	
87	7-0		Module Media Interface Code	see Note	1 below	
88	7-4		Host Lane Count 1000b 8 host electrical		8 host electrical lanes	
	3-0		Media Lane Count 0001b 1 media lane		1 media lane	
89	7-0		Host Lane Assignment Options 01h Permis		Permissible first host lane	
				number for Application		
01h:176	7-0		Media Lane Assignment Options 01h Perm		Permissible first media lane	
					number for Application: lane 1	

Table 5 CMIS Application Advertisement for 400ZR

Note 1: Module Media Interface Codes are generally defined in SFF-8024. Two codes are defined for the 400ZR application: 3Eh (400ZR, DWDM amplified) and 3Fh (400ZR, single wavelength unamplified).

6.1.2 400ZR Loopback Implementation

Generic register-based management of 400ZR loopbacks shall be possible via the existing CMIS registers. Note that CMIS allows to manage only four loopbacks while a 400ZR module actually provides a set of six loopbacks.

Table 6: Loopback Mapping to CMIS describes the six 400ZR loopbacks and their possible mapping to the four CMIS controls, including the default mapping. Vendors can choose a non-default set of 4 loopbacks and they must clearly document what they have selected. If a vendor chooses to implement the Modem Rx loopback, they can use it as the Media Side Input or as the Host Side Output loopback. If a vendor chooses to implement the Modem Tx loopback, they can use it as the Host Side Input or as the Media Side Output loopback.

Table 6: Loopback Mapping to CMIS

400 ZR Loopback Name	CMIS Loopback	Default	Description
Media Side Rx Loopback	Media Side Input	Y	Loopback in DSP. After polarity split and symbol de- interleave -> Grey mapper, symbol Interleave. Network loop timed.
Modem Rx Loopback	Media Side Input or Host Side Output	N	Loopback after GMP De-mapping -> GMP mapping. Data retransmitted relative to local clock.
Host Side Rx Loopback			Loopback after distribution/interleaving block on host ingress path, and before lane reorder and interleave
Host Side Tx Loopback	Host Side Input	Y	Loopback after Alignment lock and lane Deskew -> PMA sublayer. Host loop timed.
Modem Tx Loopback	Host Side Input or Media Side Output	N	Loopback after GMP mapping -> GMP Demapping. Data re-transmitted relative to local clock
Media Side Tx Loopback	Media Side Output	Y	Loopback after TX DSP processing blocks and before RX DSP processing blocks

6.1.3 Note on SOPMD implementation

Note: between C-CMIS 1.1 and 1.2, SOPMD was split into a HG (High Granularity) and an LG (Low Granularity) reading. The original SOPMD became HG SOPMD and LG SOPMD was added. The advertising in 42h:131 was for the original SOPMD and should have become the HG SOPMD advertising bit but it was erroneously listed as LG SOPMD advertising and HG SOPMD added at 42h:138. We do not plan to reverse this order at this point and will keep the advertising from C-CMIS 1.2.

6.1.4 Note on Q factor

The reported Q factor should follow the definition presented in ITU-T Series G, supplement 41 (02/2018), section 7.1.1.

7 <u>Coherent Extensions to CMIS</u>

This chapter defines the extensions to CMIS referred to as C-CMIS.

7.1 PM Interval

The PM interval is defined by the host. The host uses the PM freeze mechanism that is defined in the VDM section of [CMIS] in page 2Fh:144-145. The basic update period for VDM monitors is defined as one second. Unfrozen VDM monitors should be updated at least once per second.

7.2 Flag Conformance

Table 7 Coherent Lane Specific Flag Conformance describes the flag conformance for all lanespecific flags, per data path state. In data path states where a flag is indicated as 'Not Allowed', the module shall not set the associated flag bit while the data path is in that state. The flag conformance shown in Table 7 Coherent Lane Specific Flag Conformance is applicable to High Alarm, Low Alarm, High Warning and Low Warning for each listed VDM Coherent Identifier and other coherent flags.

Table 7 Coherent Lane Specific Flag Conformance

DataPath	DataPath			DataPath	DataPath	DataPath
Deactivated	Initialized	DataPathInit	DataPathDeinit	Activated	TxTurnOn	TxTurnOff
Not Allowed	Allowed	Not Allowed	Not Allowed	Allowed	Allowed	Allowed

7.3 Versatile Diagnostics Monitor (VDM) Extensions

The VDM functionality and some basic VDM monitors are defined in CMIS. Each VDM monitor has an associated numerical identifier, and the identifiers for C-CMIS defined monitors are defined in Table 8: Identifiers for Coherent Monitors (taking values from a range reserved for C-CMIS). All VDM parameters are optional.

Note: If there is agreement on the flag conformance shown in Table 8: Identifiers for Coherent Monitors, the table could be replaced with a statement on which States the conformance is Allowed or Not Allowed since the VDM Coherent Identifiers share the same flag conformance.

- the module shall update the register values of VDM real-time (current value) monitors every second.

- the module shall update the register values of VDM statistics (min, max, average) monitors every second, unless the host has requested to freeze statistics registers via the CMIS FreezeRequest bit 2Fh:144.7 (see [CMIS] for a description of the freeze mechanism and its usage).

7.3.1 Data Path Monitors

Unless specified differently, the VDM monitors for a DCO are all associated with a data path. Therefore, the lane or data path identifier (bits 3-0 of the MSB of VDM Configuration Registers in pages 20h-23h) of those VDM monitors shall indicate the first lane of the relevant data path.

Identifier	Description	Data Type	LSB Scaling	Unit
128	Modulator Bias X/I	U16	100/65,535	%
129	Modulator Bias X/Q	U16	100/65,535	%
130	Modulator Bias Y/I	U16	100/65,535	%
131	Modulator Bias Y/Q	U16	100/65,535	%
132	Modulator Bias X_Phase	U16	100/65,535	%
133	Modulator Bias Y_Phase	U16	100/65,535	%
134	CD – high granularity, short link: Note2	S16	1	Ps/nm
135	CD – low granularity, long link: Note2	S16	20	Ps/nm
136	DGD	U16	0.01	Ps
137	SOPMD – high granularity	U16	0.01	Ps^2
138	PDL	U16	0.1	dB
139	OSNR	U16	0.1	dB
140	eSNR	U16	0.1	dB
141	CFO	S16	1	MHz
142	EVM Note 3:	U16	100/65,535	%
143	Tx Power	S16	0.01	dBm
144	Rx Total Power	S16	0.01	dBm
145	Rx Signal Power	S16	0.01	dBm
146	SOP ROC	U16	1	krad/s
147	MER	U16	0.1	dB
148	Clock recovery loop: Note1	S16	100/32,767	%
149	SOPMD – low granularity	U16	1	Ps^2
150	SNR_margin	S16	0.1	dB
151	Q-factor	U16	0.1	dB
152	Q-margin	S16	0.1	dB
153	CFO-Low Granularity	S16	5	MHz

Table 8: Identifiers for Coherent Monitors

Note1: The clock recovery control loop monitor range will be -100 to 100% with nominal at 0%. Defect thresholds are set by the vendor to indicate that operation is outside of the normal range and traffic impact may be imminent. It is understood that the monitor value is a vendor-specific best-effort metric without guaranteed semantics, except for being monotonic. Values reported by different modules are not comparable.

Note2: CD is a measured value of the Chromatic dispersion of the media side fiber as estimated from DSP compensation. For C-Band applications, as the fiber length increases, this estimated value is expected to increase.

Note 3: EVM_modem has been renamed to EVM and will provide the recommended EVM measurement for the applicable IA.

7.4 Media Interface registers

Media interface registers are in banked pages with each bank referring to the media interface of a single media lane (wavelength). The bank index of a data path is the smallest index of the media lanes belonging to the data path.

Table 9: Media Interface registers

Page Number	Page Description	Notes
30h	Media Lane Configurable Thresholds	
31h	Media Lane Provisioning	
32h	Media Lane Flag Masks	
33h	Media Lane Flags and Status	
34h	Media Lane FEC Performance Monitoring	
35h	Media Lane Link Performance Monitoring	
36-37h	Reserved	

7.4.1 Media Lane Configurable Thresholds (page30h)

Page 30h is a banked page with each bank referring to the media interface of a single media lane (wavelength). The bank index of a data path is the smallest index of the media lanes belonging to the data path.

7.4.2 Power related thresholds

Page 30h allows the host to configure optical receive power related thresholds, alarms or warnings flags, and masks. By default, the module uses thresholds advertised in page 02h, however, hosts can program their own thresholds in page 30h. The Page 30h thresholds should be used for VDM power flags and do not overwrite the Page 02h thresholds which have results displayed in Page 11h. These configured thresholds must be in the range advertised by the module on page 41h.

Hysteresis around the thresholds is left as an implementation detail.

7.4.3 Link degradation feature

Page 30h allows to configure link degradation detection and reporting for two types of link degradations [400ZR IA]: FEC Detected Degrade (FDD) and FEC Excessive Degrade (FED).

Link degradation detection requires monitoring the pre-FEC BER over a performance monitoring interval, as described in detail in [400ZR IA].

When FDD reporting is enabled in 30h:168.0, the module compares the average BER computed over the PM interval against two thresholds: When the average BER exceeds the activate FDD BER threshold, FDD is asserted and the alarm bit 33h:132.0 (IRxFddPm) is set. When the average BER drops below the clear FDD BER threshold, FDD is deasserted and the alarm bit clears. The alarm bit should be updated at least once per second.

When FED is enabled in 30h:168.1, the module performs analogous operations using the FED thresholds and reports FED via alarm bit 33h:132.1 (IRxFedPm).

7.5 Host Interface registers

The host interfaces of different data paths are described in pages with different bank index. The bank index for a data

The host interfaces of different data paths are described in pages with different bank index. The bank index for a data path is the smallest lane index of all host lanes of the data path, bank 0 =

lane1. For an application that supports 4x100GE (GAUI2) for host interfaces, the banks would be 0, 2, 4, and 6.

Table 16: Host Interface regis	sters
--------------------------------	-------

Page Number	Page Description	
38h	Data Path Host Interface Configuration	
39h	Reserved Data Path Interface Future Use	
3Ah	Data Path Host Interface Performance Monitoring	
3Bh	Data Path Host Interface Flags and Masks	
3C-3Fh	Reserved	

7.5.1 Data Path Host Interface Configuration (Page 38h)

The host uses page 38h to configure data path host interface specific features. One configurable feature is the host link degrade monitoring. This optional capability requires monitoring the pre-FEC BER in the Ethernet RS(544,514) decoder block over a performance monitoring interval. Section 8.8.4 in the 400ZR Implementation Agreement [400ZR IA] describes the details of the host Link Degrade Indication (LDI) functions. The 400ZR IA also defines monitoring for the FEC Detected Degrade (FDD) and FEC Excessive Degrade (FED) functions, which that the host can configure per data path interface on page 38h and associated banked pages.

The enable bits for the FDD and FED are located in 38h:136.1-0. When the host enables FDD, the module compares the FDD activate and clear BER thresholds to the average BER computed over the PM interval. If the average BER exceeds the activate FDD BER threshold FDD is set and the over PM Interval Latch is asserted (3Bh:192.0). If the average BER drops below the clear FDD BER threshold, the state of FDD clears. The alarm bit should be updated at least once per second. The module performs analogous operations when the host enables FED, except that that asserted alarm bit for FED is located in 3Bh:192.1.

Hysteresis will be left as an implementation detail.

Table 17: Data Path Host Interface Configuration (Page 38h)

7.5.2 Data Path Host Interface Performance Monitoring (Page 3Ah)

Page 3Ah contains optional host read-only statistics reporting of errors on the data path host interface. The module collects the information in these registers during the prior PM interval. The bank index for a data path is the smallest lane index of all host lanes of the data path.

Table 18: Data Path Host Interface Performance Monitoring (Page 3Ah)

Byte	Bits	Name	Description	Туре
128- 135	63-0	txBitsPm	Number of bits received from the host side during prior PM interval. U64.	RO

136- 143	63-0	txBitsSubIntPm	Number of bits received from the host side during any sub-interval (CMIS fine interval) of prior PM interval. U64.	RO
144- 151	63-0	txCorrBitsPm	Number of corrected bits received from the host side during prior PM interval. U64.	RO
152- 159	63-0	txMinCorrBitsSubIntPm	Minimum number of corrected bits received from the host side during any sub-interval (CMIS fine interval) of prior PM interval. U64.	RO
160- 167	63-0	txMaxCorrBitsSubIntPm	Maximum number of corrected bits received from the host side during any sub-interval (CMIS fine interval) of prior PM interval. U64.	RO
168- 171	31-0	txFramesPm	Number of frames received from the host side during prior PM interval. U32.	RO
172- 175	31-0	txFramesSubIntPm	Number of frames received from the host side during any sub-interval (CMIS fine interval) of prior PM interval. U32.	RO

7.6.3 Performance Monitoring Advertisement (Page 42h)

Page 42h advertises which media and host lane performance monitors and performance statistics are implemented.

The implementation advertisements on this page are global, i.e. if a feature is advertised as implemented (bit value 1b), this feature is implemented for all lanes (banks).

7.6.4 Media Lane Provisioning Advertisement (Page 43h)

Page 43h advertises which media lane provisioning parameters are implemented. The implementation advertisements on this page are global, i.e. if a feature is advertised as implemented (bit value 1b), this feature is implemented for all media lanes (banks).

Table 24: Media Lane Provisioning Advertisement (Page 43h)

10 Appendix A: Glossary

The Glossary presents definitions for acronyms and terms used in this IA.

Table 29: Glossary

Term	Definition	Term	Definition
BER	Bit Error Rate	LOS	Loss of Signal
CD	Chromatic Dispersion	LSB	Least Significant Bit
CDB	Command Data Block	MER	Modulation Error Ratio
CFO	Carrier Frequency Offset	MHz	MegaHertz
CMIS	Common Management Interface	MSB	Most Significant Bit
CIVIIS	Specification	IVISE	
CMU	Clock Monitor Unit	nm	nanometer
COR	Clear on Read	NVR	Non-Volatile Memory
dB	Decibels	OSNR	Optical Signal to Noise Ratio
dBm	Decibels reference to 1mW	OOA	Out of Alignment
DGD	Differential Group Delay	PDL	Polarization Dependent Loss
eSNR	Electrical Signal to Noise Ratio	PM	Performance Monitoring
EVM_mo	Error Vector Magnitude of the	PMA	Physical Medium
dem	entire modem	F IVIA	
FDD	FEC Detected Degrade	PMD	Polarization Mode Dispersion
FEC	Forward Error Correction	Q-Factor	Decibel (dB) value representing BER
FED	FEC Excessive Degrade	Ps	Picoseconds
FER	Frame Error Rate	Rx	Receiver
FIFO	First In First Out	RF	Remote Fault
GHz	GigaHertz	RO	Read Only
GMP	Generic Mapping Procedure	ROC	Rate of Change
IA	Implementation Agreement	RW	Read Write
Krad/s	Thousand rads per second	SOP	State of Polarization

LF	Local Fault	SOPMD	Second Order Polarization Mode Dispersion
LOA	Loss of Alignment	SOP ROC	State Of Polarization Rate Of Change
LOF	LOF Loss of Frame		Transmitter
LOL	Loss of Lock	VDM	Versatile Diagnostics Monitor
LOM	Loss of Multiframe	VR	Volatile Memory

11 Appendix B: Open Issues / Current Work Items

- Add additional loopbacks through CDB to support all 6 loopbacks as defined in the 400ZR IA
- Add constellation pull through CDB
